

OCTOBER 9, 1978 – ORD NEBRASKA

On the morning of October 9, 1978, near Ord, Nebraska, USA, tenth grade student Deanne Kearns observed a gray metallic disc hovering 200 to 300 feet off the ground.

As she watched, a beam of light shot downward from the disc to the ground and two "things" floated down to the ground through the beam.

The entities looked around, took some samples of shrubs and soil, and then ascended back into the disc in the beam of light.

The girl described the two "things" as being 5 to 6 feet tall, blackish-brown in color, their heads were blob-like, and they had tentacles on their sides.

After about ten minutes or so, the disc shot straight up into the sky and was out of sight in a few seconds.
