## A LEVEL MATHS - STATISTICS REVISION NOTES

## PLANNING AND DATA COLLECTION

- PROBLEM SPECIFICATION AND ANALYSIS

What is the purpose of the investigation?
What data is needed?
How will the data be used?

- DATA COLLECTION

How will the data be collected?
How will bias be avoided?
What sample size is needed?

- PROCESSING AND REPRESENTING

How will the data be 'cleaned'?
Which measures will be calculated?
How will the data be represented?

- INTERPRETING AND DISCUSSING

## 1 DATA COLLECTION

Types of data Categorial/Qualitative data - descriptive Numerical/ Quantitative data

## Sampling Techniques

Simple random Sampling - each member of the population has an equal chance of being selected for the sample
Systematic - choosing from a sampling frame - if the data is numbered 1, 2, 3, 4....randomly select the starting point and then select every nth item in the list

Stratified - A stratified sample is one that ensures that subgroups (strata) of a given population are each adequately represented within the whole sample population of a research study.
Sample size from each subgroup $=\frac{\text { size of whole sample }}{\text { size of whole population }} \times$ population of the subgroup
Quota Sampling - sample selected based on specific criteria e.g age group
Convenience / opportunity sampling - e.g the first 5 people who enter a Leisure Centre or teachers in single primary school surveyed to find information about working in primary education across the UK

Self Selecting Sample - people volunteer to take part in a survey either remotely (internet) or in person

## 2 PROCESSING AND REPRESENTATION

Categorial/Qualitative data |  | Pie Charts |
| ---: | :--- |
|  | Bar charts (with spaces between the bars) |
|  | Compound/Multiple Bar charts |
|  | Dot charts |
|  | Pictograms |

## Numerical/ Quantitative data

Represented using - Frequency diagrams
Histograms
Cumulative Frequency diagrams
Box and Whisker Plots
Measures of central tendency - Mode (can have more than one mode)

- Median - middle value of ordered data
- Mean $\frac{\sum x}{n}$ or $\frac{\Sigma f x}{\Sigma f}$

If the mean is calculated from grouped data it will be an estimated mean

## Measures of Spread

- Range (largest - smallest value)
- Inter Quartile Range : Upper Quartile - Lower Quartile (not influenced by extreme values)
- Standard Deviation (includes all the sample )

Finding the quartiles (sample size $=\mathrm{n}$ )

## $n$ is odd (Data 2, 4, 5, 7, 8, 9, 9)

Lower Quartile : middle value of data less than the median

Upper Quartile : middle value of data greater than the median
$n$ is even (Data $2,4,5,5,7,8,9,10$ )

## STANDARD DEVIATION (sample)

$$
\begin{array}{r}
\mathbf{s}=\sqrt{\frac{s_{x x}}{n-1}} \text { where } S_{x x}=\sum(x-\bar{x})^{2} \text { or } S_{x x}=\sum x^{2}-n \bar{x}^{2} \\
\text { or } S_{x x}=\sum f x^{2}-n \bar{x}^{2}
\end{array}
$$

$$
\mathbf{s}^{2}=\frac{s_{x x}}{n-1}
$$

## STANDARD DEVIATION (population)

Standard deviation $\quad \sigma=\sqrt{\frac{s_{x x}}{n}} \quad$ Variance $=\sigma^{2}=\frac{s_{x x}}{n}$

Check with your syllabus/exam board to see if you are expected to divide by $n$ or $n-1$ when calculating the standard deviation

BIVARIATE DATA - investigating the 'association/ correlation' between 2 variables

- The explanatory/control/independent variable is usually plotted on the horizontal axis
- A numerical measure of correlation can be calculated (Spearman's Rank, Product Moment correlation coefficient) $-1 \leq r \leq 1$
-1 perfect negative correlation
0 no correlation
1 perfect positive correlation.
- Take care when interpreting the correlation coefficient (look at the scatter graph)

4 'CLEANING THE DATA' removing 'Outliers or Anomalies'

Remove values which are $1.5 \times$ Inter Quartile range above or below the U/L Quartile

Remove values which are $2 \times$ Standard Deviation above or below the mean.

## PROBABILITY

- Outcome : an event that can happen in an experiment
- Sample Space : list of all the possible outcomes for an experiment

## Notation

$A \cap B \quad \mathrm{~A}$ and B both happen

For independent events

$$
\mathrm{P}(A \cap B)=\mathrm{P}(\mathrm{~A}) \times \mathrm{P}(\mathrm{~B})
$$

$A \cup B \quad \mathrm{~A}$ or B or both happen

$$
\mathrm{P}(A \cup B)=\mathrm{P}(\mathrm{~A})+\mathrm{P}(\mathrm{~B})-\mathrm{P}(A \cap B)
$$

$$
\mathrm{P}\left(A^{\prime}\right)=1-\mathrm{P}(\mathrm{~A})
$$

$A^{\prime} \quad$ A does not happen

Mutually Exclusive events - two or more events which cannot happen at the same time

$$
\begin{aligned}
& \mathrm{P}(A \cap B)=0 \\
& \mathrm{P}(A \cup B)=\mathrm{P}(\mathrm{~A})+\mathrm{P}(\mathrm{~B})
\end{aligned}
$$

|  | Male | Female | TOTAL |
| :--- | :---: | :---: | :---: |
| Junior | 15 | 20 | 35 |
| Senior | 32 | 33 | 65 |
| TOTAL | 47 | 53 | 100 |

Find the probability of
a) picking a female $=0.53$
b) pickling a junior male $=0.15$
c) not picking a junior male $=1-0.15=0.85$
d) picking a junior and a senior when 2 members are selected at random $\frac{35}{100} \times \frac{65}{99} \times 2=0.460$

On his way to work Josh goes through 2 sets of traffic lights. The probability that he has to stop at the $1^{\text {st }}$ set is 0.7 and the probability for the $2^{\text {nd }}$ set is 0.6 (assume independence)

Find the probability that he has to stop at only one of the traffic lights.

Stop and Not Stop or Not Stop and Stop

$$
\begin{aligned}
& 0.7 \times 0.4 \quad+\quad 0.3 \times 0.6 \\
& =0.46
\end{aligned}
$$

## Conditional Probability

When the outcome of the first event effects the outcome of a second event the probability of the second event happening is conditional on the probability of the first event happening

- $P(B \mid A)$ means that the probability of $B$ given that $A$ has occurred
- $\mathrm{P}(\mathrm{B} \mid \mathrm{A})=\frac{P(A \cap B)}{P(A)}$ so $P(A \cap B)=P(A) \mathrm{P}(\mathrm{B} / \mathrm{A})$
- If the probabilities needed are not stated clearly a tree diagram or venn diagram may help

In a box of dark and milk chocolates there are 20 chocolates. 12 of the chocolates are dark and 3 of these dark chocolates are wrapped. There are 5 wrapped chocolates in the box. Given that a chocolate chosen is a milk chocolate, what is the probability that it is not wrapped.

P(Not Wrapped/Milk)

$$
=\frac{P(\text { Not wrapped } \cap \text { Milk })}{P(\text { Milk })}=\frac{6}{20} \div \frac{8}{20}=\frac{3}{4}
$$

6 PROBABILITY DISTRIBUTIONS
A probability distribution shows the probabilities of the possible outcomes $\quad \sum P(X=x)=1$

| $x$ | 0 | 1 | 2 |
| :---: | :---: | :---: | :---: |
| $P(X=x)$ | 0.5 | $3 y$ | $2 y$ |

Calculate the value of y $\sum P(X=x)=1$
$0.5+3 y+2 y=15 y=0.5 \quad y=0.1$

Calculate $\mathrm{E}(\mathrm{X})$
$0 \times 0.5+1 \times 0.3+2 \times 0.2=0.7$

- 2 possible outcomes
- fixed number of trials $n$
- The trials are independent
- $E(x)=n p$
$\mathrm{P}\left(\right.$ getting r successes out of n trials) $={ }_{\mathrm{n}} \mathrm{C}_{\mathrm{r}} \times \boldsymbol{p}^{r} \times(\mathbf{1}-\boldsymbol{p})^{\boldsymbol{n}-r}$
Research has shown that approximately $10 \%$ of the population are left handed. A group of 8 students are selected at random.

What is the probability that less than 2 of them are left handed?
$X$ : number of left handed students
$p=0.1 \quad 1-p=0.9 \quad n=8$
Less than $2: P(0)+P(1)$
$\mathrm{P}(0)=0.9^{8}$
$P(1)={ }_{8} C_{1} \times 0.1 \times 0.9^{7}$

$$
P(x<2)=0.813 \quad \text { (this can be found using tables) }
$$

## USING CUMULATIVE TABLES

- Check if you can use your calculator for this
- Remember the tables give you less than or equal to the lookup value
- List the possible outcomes and identify the ones you need to include $\mathrm{P}(\mathrm{X}<5) \begin{array}{llllllllllll}0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & \text { Look up } \mathrm{x} \leq 4\end{array}$ $P(X \geq 4) \quad 0 \quad 1 \quad 2 \quad 3 \begin{array}{lllllllll} & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 1-\text { Look up } x \leq 3\end{array}$

## 8 THE NORMAL DISTRIBUTION

- Defined as $X \sim N\left(\mu, \sigma^{2}\right)$ where $\mu$ is the mean of the population and $\sigma^{2}$ is the variance
- Symmetrical distribution about the mean such at
- two-thirds of the data is within 1 standard deviation of the mean
- $95 \%$ of the data is within 2 standard deviations of the mean
- $99.7 \%$ of the data is within 3 standard deviations of the mean
- points of inflection of the Normal curve lie one standard deviation either side of the mean

- $\mathrm{X} \sim \mathrm{N}\left(\mu, \sigma^{2}\right)$ can be transformed to the standard normal distribution $\mathrm{Z} \sim \mathrm{N}(0,1)$ using

$$
z=\frac{x-\mu}{\sigma}
$$

## Calculating probabilities

Probabilities can be calculated by either using the function on a calculator or by transforming the distribution to the standard normal distribution
A sketch graph shading the required region is a good idea.
IQs are normally distributed with mean 100 and standard deviation 15 . What percent of the population have an IQ of less than 120 ?

$$
X \sim N\left(\left(100,15^{2}\right)\right.
$$

$$
\mathrm{P}(\mathrm{X}<120) \quad \mathrm{P}\left(\mathrm{z}<\frac{120-100}{15}\right)
$$

$P(z<1.333)=0.909$

90.9 \% of the population have an IQ less than 120

## Calculating the mean, standard deviation or missing value (Using Inverse Normal)

If the probability is given then you need to work backwards to find the missing value(s)
The time, X minutes to install an alarm system may also be assumed to be a normal random variable such that $P(X<160)=0.15$ and $P(X>200)=0.05$
Determine to the nearest minute, the values for the mean and standard deviation of $X$

$\mathrm{X}=160$

Use the tables or the calculator function to find the $z$ values corresponding to the probabilities given
$P(z<-1.0364)=0.15$
$P(z>1.6449)=0.05$
$\frac{160-\mu}{\sigma}=-1.0364 \quad 160-\mu=-1.0364 \sigma$
$\frac{200-\mu}{\sigma}=1.6449 \quad 200-\mu=1.6449 \sigma$
Solving simultaneously gives $\mu=175$ minutes $\sigma=15$ minutes

## Using the normal distribution to approximate a binomial distribution

For a valid result the following conditions are suggested

$$
X \sim B(n, p) \quad n p>5 \text { and } n(1-p)>5 \quad \text { (ie } p \text { is close to } 1 / 2 \text { or } n \text { is large) }
$$

If the conditions are true then
$X \sim B(n, p)$ can be approximated using $X \sim N(n p, n p(1-p))$
(NB As the binomial distribution is discrete and the Normal distribution is continuous some exam boards specify that a continuity correction is used. If you are calculating $P(X<80)$ you use $P(X<79.5)$ in your normal distribution calculation)

```
A dice is rolled 180 times. The random variable X is the number of times three is scored.
Use the normal distribution to calculate P(X < 27)
X~B(180, \frac{1}{6})\quad\mathrm{ can be approximated by X }~N(30,25)
Without continuity correction With continuity correction
P(X<27) = 0.274 (3 s.f.)
P( X < 26.5) = 0.242 (3 s.f.)
```

## 9 SAMPLING

If you are working with the mean of a sample of several observations from a population (eg calculating the probability that the mean $(\bar{x})$ is less than a specified value) then the following distribution must be used
$\bar{X} \sim N\left(\mu, \frac{\sigma^{2}}{n}\right)$ where n is the sample size, $\mu$ is the population mean and $\sigma^{2}$ is the population variance
Alex spends $X$ minutes each day looking at social media websites. $X$ is a random variable which can be modelled by a normal distribution with mean 70 minutes and standard deviation 15 minutes. Calculate the probability that on 5 randomly selected days the mean time Alex spends on social media is greater than 85 minutes.

$$
\mathrm{n}=5 \quad \bar{X} \sim N\left(70, \frac{15^{2}}{5}\right) \quad \mathrm{P}(\bar{X}>85)=0.0127 \text { (3 s.f.) }
$$

## 10 <br> HYPOTHESIS TESTING

## Binomial

Set up the hypothesis

$$
\begin{array}{lll} 
& H_{1}: p<a & \text { one sided test } \\
H_{0}: p=a & H_{1}: p \neq a & \text { two sided test } \\
& H_{1}: p>a & \text { one sided test }
\end{array}
$$

- State the significance level (as a percentage) - the lower the value the more stringent the test.
- State the distribution/model used in the test Binomial ( $\mathrm{n}, \mathrm{p}$ )
- Calculate the probability of the observed results occurring using the assumed model
- Compare the calculated probability to the significance level - Accept or reject $\mathrm{H}_{\circ}$
- Write a conclusion (in context)

Reject $\mathrm{H}_{\mathrm{o}}$
"There is sufficient evidence to suggest that $\qquad$ is underestimation/overestimating......."

Accept $\mathrm{H}_{0}$
"There is insufficient evidence to suggest that $\qquad$ .increase/decrease......therefore we cannot reject the null hypothesis that $\mathrm{p}=\mathrm{a}$."

The probability that patients have to wait more than 10 minutes at a GP surgery is 0.3 . One of the doctors claims that there is a decrease in the number of patients having to wait more than 10 minutes. She records the waiting times for the next 20 patients and 3 wait more than 10 minutes. Is there evidence at the $5 \%$ level to support the doctors claim?
$H_{0}: p=0.3$
$H_{1}: p<0.3$
5\% Significance level
$X=$ number of patients waiting more than 20 minutes
$X$ Binomial $(20,0.3)$
Using tables $\mathrm{P}(\mathrm{X} \leq 3)=0.107 \quad(10.7 \%)$
10.7\% > 5\%

There is insufficient evidence to suggest that the waiting times have reduced therefore accept Ho and conclude that $p=0.3$

## CRITICAL VALUES AND REGIONS

For the above example
Binomial ( $20,0.3$ ) $5 \%$ Significance Level

$$
\begin{array}{lll}
P(X \leq 0)=0.000798 & (0.01 \%) & \\
P(X \leq 1)=0.00764 & (0.08 \%) & \\
P(X \leq 2)=0.0355 & (3.55 \%) & <5 \% \\
\hline P(X \leq 3)=0.107 & (10.7 \%) & >5 \%
\end{array}
$$

Critical Values: 0,1 , and 2
Critical Region: X $\underline{\underline{2}}$

A sweet manufacturer packs sweets with $70 \%$ fruit and the rest mint flavoured. They want to test if there has been a change in the ratio of fruit to mint flavours at the $10 \%$ significance level. To do this they take a sample of 20 sweets. What are the critical regions?
$X=$ number of fruit sweets $\quad \operatorname{Binomial}(20,0.7)$
$H_{0}: p=0.7$
$\mathrm{H}_{1}: \mathrm{p} \neq 0.7$
10\% Significance level (2 tailed - 5\% at each tail)

| Lower tail | $P(X \leq 10)=0.0480$ | $4.8 \%$ | Critical Region $X \leq 10$ | (Critical Value $=10)$ |
| :--- | :--- | :--- | :--- | :--- |
|  | $P(X \leq 11)=0.113$ | $11.3 \%$ |  |  |
| Upper tail | $P(X \geq 17)=0.107$ | $10.7 \%$ |  |  |
|  | $P(X \geq 18)=0.035$ | $3.5 \%$ | Critical Region $X \geq 18$ | (Critical value $=18)$ |

Critical Regions Critical Region $X \leq 10$ or $X \geq 18$

Normal Distribution: testing for changes in the mean

1. Set up the hypothesis

$$
\begin{array}{ll}
\mathbf{H}_{\mathbf{o}}: \boldsymbol{\mu}=\boldsymbol{\mu}_{\mathbf{0}} & \mathrm{H}_{1}: \mu<\mu_{0} \text { one sided test mean has decreased } \\
\mathrm{H}_{1}: \mu \neq \mu_{0} \text { two sided test } \mathrm{H}_{1}: \mu \neq \mu_{0} \text { two sided test } \\
\mathrm{H}_{1}: \mu>\mu_{0} \text { one sided test mean has increased }
\end{array}
$$

## $\mathrm{H}_{1}: \mu<\mu_{0}$ one sided test mean has decreased

$H_{1}: \mu \neq \mu_{0}$ two sided test mean has changed

## $H_{1}: \mu>\mu_{0}$ one sided test mean has increased

2. Investigate the value you are working with by either

Method 1: See if your observed value lies in the critical region - reject $\mathrm{H}_{0}$ if it does
or
Method 2: Calculate the probability ( $p$ value) of getting the observed value (or greater if testing for increase) if $\mathrm{H}_{0}$ is true and reject $\mathrm{H}_{0}$ if the probability is less than the significance level
3. Write a conclusion DO NOT just state 'Accept/Reject $\mathrm{H}_{0}$ '

Accept $\mathrm{H}_{\text {o }}$
"There is insufficient evidence to suggest that the mean of ...... therefore we cannot reject the null hypothesis that $\mu=\mu_{0}$.

## Reject $\mathrm{H}_{\mathbf{0}}$

"There is sufficient evidence to suggest that the mean has changed and based on the results conclude that the mean of......has increased/decreased/does not equal $\mu_{0}{ }^{\prime \prime}$

The test results of a large group of students are thought to follow a normal distribution with mean 90 points and variance 80 points. A random sample of 20 students is found to have a mean of 94 points. Test at the $5 \%$ significance level to investigate the claim that the mean has increased.
$\mathrm{H}_{\mathrm{o}}: \mu=90 \quad \mathrm{H}_{1}: \mu>90 \quad \bar{X} \sim N\left(90, \frac{80}{20}\right)$

## METHOD 1

## METHOD 2

(93.3 from calculator)

Using tables:

$$
\begin{aligned}
& P(x>94) \quad \frac{94-90}{\sqrt{\frac{80}{20}}}=2 \\
& p=P(z>2)=0.02275
\end{aligned}
$$

$z=1.6449$ (for 5\% significance)
$1.6449=\frac{x-90}{\sqrt{\frac{80}{20}}}$ rearrange to give $\mathrm{x}=93.3$
As $94>93.3$ the observed value is in the critical Region indicating that

Significance level 5\% = 0.05
As $0.02275<0.05$
there is sufficient evidence to suggest that the mean has increased indicating an improved performance in the test

CORRELATION COEFFICIENT: testing to investigate whether the linear relationship represented by $r$ (calculated from the sample) is strong enough to use the model the relationship in the population
$r=$ correlation coefficient calculated using sample size $n$
$\rho=$ unknown population correlation coefficient
The test checks whether $\rho$ is 'close to 0 ' or 'significantly different from 0 '
$H_{0}: \rho=0 \quad$ there is no correlation between the 2 variables
$H_{1}: \rho \neq 0 \quad$ the two variables are correlated (2 tailed test)
$\mathrm{H}_{1}: \rho>0 \quad$ the two variables are positively correlated (one tailed test)
$\mathrm{H}_{1}: \rho<0 \quad$ the two variables are negatively correlated (one tailed test)

The length of service and current salary is recorded for 30 employees in a large company. The product-moment correlation coefficient $r$, of the 30 employees is 0.35 . Test the hypothesis that there is no correlation between an employees length of service and current salary at the $5 \%$ significance level.
$H_{0}: \rho=0 \quad H_{1}: \rho \neq 0 \quad$ (2 tailed test) $n=30$
To be significant at the $5 \%$ level the probability of $r$ being in the critical regions must be $<0.025$

Critical value from tables $=0.3610$ leading to a critical region $r<-0.361$ and $r>0.361$
$r=0.35$ is not in the critical region so there is insufficient evidence to show that correlation is significantly different from zero
