## Multiplication on a Number Line

The above examples show how you perform multiplication on a number line.

To multiply  $5 \times 2$ , you make 5 “jumps” of 2 units each.

To multiply  $4 \times 3$ , you make 4 “jumps” of 3 units each.

To multiply  $2 \times 5$ , you make two “jumps” of 5 units each.

To multiply  $3 \times 4$ , you make 3 jumps of 4 units each.

Again, notice that 3 ‘jumps’ of 4 units each lands you at the same place on the number line as 4 “jumps” of 3 units each.  $3 \times 4 = 4 \times 3 = 12$ . This demonstrates (shows) the *commutative* property of multiplication.

## Multiplication on a Number Line

1. Write equations (multiplication problems) for each of these drawings:

$$\underline{\hspace{2cm}} \times \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$$

$$\underline{\hspace{2cm}} \times \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$$

$$\underline{\hspace{2cm}} \times \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$$

2. Use the number lines to perform these multiplications:

$$6 \times 5 = \underline{\hspace{2cm}}$$

$$7 \times 4 = \underline{\hspace{2cm}}$$

$$3 \times 10 = \underline{\hspace{2cm}}$$
