There is no general provision in the Occupational Health and Safety Act (OHSA), or any Ontario Statute other than section 14 of the Environmental Protection Act (EPA), which prohibits the discharge of rock or any other material that may injure any person, cause damage to property, plant or animal life, interfere with normal course of business or enjoyment of property or adversely affect the environment.<sup>1</sup>

In 1962, blasting from the Dufferin Aggregates Milton Quarry blew a hole in the Niagara Escarpment, one of Southern Ontario's most prominent landscapes. The Escarpment is a major limestone outcrop running through a large part of southern Ontario from Niagara Falls to the Bruce Peninsula. It is simultaneously a site with unique ecological systems...prime agricultural lands, high scenic and amenity value,...proximity to urban centres, and valuable aggregate mineral deposits, as well as being significant to local Indigenous communities as traditional territory and for legal, economic, spiritual and historic reasons....The transformation of such a prominent landscape was a catalyst for an emerging environmental movement in the province and for the social and political construction of the Escarpment as a specific and valuable landscape....A 1968 government-commissioned expert report mapped and documented the entire Niagara Escarpment area in response to growing public awareness about the unique features of the area and concern about the impact of the aggregate mineral industry....In 1990, the area was designated as a UNESCO World Biosphere reserve....[p. 197].<sup>2</sup>[citations omitted]

## **SETBACKS TO AVOID CONFLICTING LAND USES & ADVERSE EFFECTS**

Quarries<sup>3</sup> can conflict with existing land uses, and have adverse environmental, physical, social and economic impacts on the surrounding environment and its inhabitants. Land use controls are an effective way of minimizing conflicts between competing land uses and avoiding adverse effects.

In discussing the role of zoning in avoiding conflicting land uses, the Supreme Court of Canada in *Saint-Romuald v. Olivier*<sup>4</sup> makes reference to private law remedies designed, in a general sense, to protect neighbourhood amenities from damaging externalities occasioned by intruding non-compatible and undesirable land use activities:

*The doctrine of Rylands v. Fletcher (1868), L.R. 3 H.L. 330, imposes virtually absolute liability on owners who bring on their land "anything likely to do mischief if it escapes" and causes damage to a neighbour, unless the escape was due to the neighbour's default (pp. 339-40) [para. 9].*

<sup>1</sup> *Castonguay Blasting Ltd., v. Her Majesty the Queen in Right of the Province of Ontario*. Respondent's Factum on Appeal, para. 41, SCC File No.34816. [https://www.scc-csc.ca/WebDocuments-DocumentsWeb/34816/FM020\\_Respondent\\_Her-Majesty-the-Queen-in-Right-of-the-Province-of-Ontario-as-Represented-by-the-Minister-of-the-Environment.pdf](https://www.scc-csc.ca/WebDocuments-DocumentsWeb/34816/FM020_Respondent_Her-Majesty-the-Queen-in-Right-of-the-Province-of-Ontario-as-Represented-by-the-Minister-of-the-Environment.pdf).

<sup>2</sup> Estair Suarez Van Wagner, "The Place of Private Property in Land Use Law: A Relational Examination of Ontario's Quarry Conflicts," *York University*, August 2017, PhD Dissertation. At p. 349 of the Dissertation, reference is made to Section 2.11 of the Niagara Escarpment Planning Area, which "specifically considers mineral resources, with the objective of minimizing the impact of new mineral extraction and accessory uses."

<sup>3</sup> Quarries mine consolidated bedrock, such as shale, limestone and dolostone. Blasting is required to dislodge material from the working face; crushing machines are required on a full time basis to break down the material into smaller pieces; and, when working below the water table, dewatering is required to keep the excavation area dry.

<sup>4</sup> *Saint-Romuald (City) v. Olivier*, 2001 SCC 57 (CanLII), [2001] 2 SCR 898, <<http://canlii.ca/t/51z2>>, retrieved on 2020-01-09.

As noted by the OMB in *Caldwell Construction Ltd. v. Kirkland Lake (Town)*,<sup>5</sup> the objective of land use planning is to avoid adverse effects by separating incompatible land uses or incompatible activities:

*Land use planning differentiates and separates incompatible uses to prevent or minimize adverse effects on the persons occupying those land uses. The individual characteristics of the current occupants of a land use do not set the standard for establishing an adverse effect. The standard is more general and relates to an assessment of compatibility between two land uses such that persons generally may occupy those uses without adverse effects [para. 70].*

Setback requirements prohibiting quarry uses, regardless of whether blasting is involved and only permitting quarrying by special permit, are not preempted because setbacks are traditional land use regulations.<sup>6</sup>

Setbacks are controlled through enactment of zoning by-laws at the municipal level. A zoning by-law:<sup>7</sup>

- *implements the objectives and policies of a municipality's official plan (See section 2, Official plans)*
- *provides a legal way of managing land use and future development*
- *in addition to the official plan, protects you from conflicting and possibly dangerous land uses in your community*<sup>8</sup>

In Quebec, pursuant to the *Regulation respecting pits and quarries*. (Q-2, r. 7), there is a prohibition against establishing a new quarry on or within 600 metres of land zoned for residential, commercial or mixed commercial-residential use, so as to separate incompatible land uses and avoid externalizing potential adverse effects or sterilizing the use of land (i.e., private property) beyond the lot limits of a proposed quarry:

**Zoning:** *It is prohibited to establish a new...quarry, the operating site of which is located in a territory zoned by the municipal authorities for residential, commercial or mixed purposes (commercial-residential). It is also prohibited to establish a new quarry less than 600 m from such territory...(R.R.Q., 1981, c. Q-2, r. 2, s. 10.).*

Ct. 2002, [https://scholar.google.com/scholar\\_case?case=15752167703902735334&q=tinicum+tp+v+delaware+valley+concrete&hl=en&as\\_sdt=2006](https://scholar.google.com/scholar_case?case=15752167703902735334&q=tinicum+tp+v+delaware+valley+concrete&hl=en&as_sdt=2006)).

<sup>7</sup> <https://www.ontario.ca/document/citizens-guide-land-use-planning/zoning-bylaws>.

<sup>8</sup> **Hazardous** sites: means property or **lands** that could be **unsafe** for development and site alteration due to naturally occurring **hazards**. These include unstable soils (sensitive marine clays [leda], organic soils) or unstable bedrock (karst topography), October 23, 2015, p. 1491 [www.mah.gov.on.ca](http://www.mah.gov.on.ca). **Blasting** is an ultrahazardous activity, and “[w]hen one engages in the inherently dangerous operation of blasting with dynamite under such conditions that the person or property of another is necessarily or obviously exposed to the danger of probable injury, he does so at his peril. He is absolutely liable for damages which result from the blasting whether he was negligent in his conduct of the operation or not. [W]here the damage resulting from the explosion has been caused, not by flying rocks, but by concussion of the atmosphere or vibration of the earth, the rule is none the less applicable. *Whitman Hotel v. Elliott Watrous Eng. Co.*, 137 Conn. 562 (Conn. 1951) 79A.2d.59.

[https://scholar.google.ca/scholar\\_case?case=17862617283316607906&q=Whitman+Hotel+Corp+v.+Elliott+%26+Watrous+Eng%27r+Co&hl=en&as\\_sdt=2006&as\\_vis=1](https://scholar.google.ca/scholar_case?case=17862617283316607906&q=Whitman+Hotel+Corp+v.+Elliott+%26+Watrous+Eng%27r+Co&hl=en&as_sdt=2006&as_vis=1).

Courts have ruled it unlawful to enact a zoning by-law for the exclusive benefit of a proposed quarry operation by imposing setback (buffer) requirements on neighbouring lands which restrict or preclude their development (i.e., de facto taking of land without compensation) and impose (externalize) unwanted adverse impacts. Any burdens placed on a proposed quarry operation, including setback requirements, to avoid adverse impacts should be borne entirely by the proponent and confined within the boundaries of the proposed quarry. Neighbouring property owners are not legally bound to subsidize a for-profit quarry operation, nor are they expected to endure the adverse impacts of a quarry operation (e.g., blasting - a hazardous activity, flyrock, concussion, vibration, noise, odour, pollution, loss of access to groundwater - a property right, traffic, personal injury, respiratory illnesses, property damage, reduced property value, etc.):

***Kozesnik v. Montgomery Twp.***<sup>9</sup> Hillsborough manifestly found that quarry operations hold a significant potential for deleterious influence upon the enjoyment of neighboring property. This is at least one basis of the acreage requirement and is the basis of the restrictions recited at the outset of this opinion fixing certain distances between phases of the operations and homes. The difficulty is that protection is afforded only for "any dwelling existing at the introduction of this ordinance." The owners of the remaining acreage are entitled to like protection to the end that the authorized uses may reasonably be pursued. The record does not clearly reveal the precise location of the parcels not controlled by 3M. We gather there are five such parcels, of which four are unimproved (the fifth, owned by plaintiffs, Slover, is largely in another zone with a small triangular rear portion jutting into the limited industrial zone). The exact location of 3M's holdings was frankly obscured for private reasons not here pertinent. But whatever the physical relation of the other parcels to 3M's, it is plain that under the 176\*176 ordinance 3M could carry on its activities within the very distances of those parcels which Hillsborough has found to be necessary to protect housing use.

We are not here concerned with that incidental and unremediable loss of value which is inevitably experienced by property abutting another zone in which lesser uses are authorized and which must be accepted for the common good. [Guaclides v. Borough of Englewood Cliffs, 11 N.J. Super. 405, 414 \(App. Div. 1951\)](#); [Gross v. Allan, 37 N.J. Super. 262, 270 \(App. Div. 1955\)](#). Rather, we have a situation in which some property owners are required for the special benefit of another proprietor to absorb part of the burden of an industrial use of acknowledged capacity to harm, and this upon the irrelevant circumstance whether their properties are or are not improved at the time of the introduction of the ordinance. The imposition is unreasonable and the classification arbitrary. [emphasis added]

It is true that where a nuisance results, it is no defense that the zoning ordinance authorized the operation and hence judicial relief may be had. [Kosich v. Poultrymen's Service Corp., 136 N.J. Eq. 571, 584 \(Ch. 1945\)](#). Nonetheless, when a zoning ordinance is being prepared, and as here the potential nuisance is recognized unless the operation be isolated, the ordinance should require the quarry operator to provide the necessary buffer and not cast the burden on the neighboring owner. If the ordinance expressly said that a property owner may not improve his land within a given distance of the quarry or processing plant, the appropriation of his property for the benefit of the quarry operator would be apparent. Cf. [Raskin v. Town of Morristown, supra \(21 N.J. 180\)](#). Principle is no less offended when the ordinance purports to place the burden upon the quarry operator but as a practical matter transfers it to neighboring owners who, while ostensibly permitted to utilize their properties, must provide their own setbacks or experience an exposure capable of hindering enjoyment. Whatever the reasonable distances may be, they 177\*177 should be measured from adjoining property lines whether or not the parcels are now improved. [emphasis added]

<sup>9</sup> *Kozesnik v. Montgomery Twp.*, 131 A, 2d 1, 24 NJ 154 (1957), [https://scholar.google.com/scholar\\_case?case=8002546886091518038&q=kozesnik+v+montgomery+twp&hl=en&as\\_sdt=2006](https://scholar.google.com/scholar_case?case=8002546886091518038&q=kozesnik+v+montgomery+twp&hl=en&as_sdt=2006). See also "Zoning Buffers: Solution or Panacea," *American Society of Planning Officials* (April 1960): 13-15, [https://planning-org-uploaded-media.s3.amazonaws.com/legacy\\_resources/pas/at60/pdf/report133.pdf](https://planning-org-uploaded-media.s3.amazonaws.com/legacy_resources/pas/at60/pdf/report133.pdf).

*Kozesnik complains that his property cannot be put to the single authorized use since he cannot associate it with a quarrying operation in Hillsborough and hence the ordinance is invalid as to his property. It was frankly conceded before us that there is nothing he can do with his property. That a restraint against all use is confiscatory and beyond the police power and statutory authorization is too apparent to require discussion. [emphasis added] Grosso v. Board of Adjustment of 183\*183 Tp. of Millburn, 137 N.J.L. 630 (Sup. Ct. 1948); Arverne Bay Construction Co. v. Thatcher, 278 N.Y. 222, 15 N.E.2d 587, 117 A.L.R. 1110 (Ct. App. 1938); 2 Metzenbaum, Law of Zoning (2d ed. 1955), p. 1416 et seq.*

In *Eastman et al. v. Dewdney Mountain Farms Ltd.*,<sup>10</sup> local residents filed an appeal seeking to set aside three OMB decisions pertaining to Trent Lakes' Official Plan and Zoning By-laws in connection with a proposed limestone quarry. On the issue of whether the OMB erred in proposing *noise mitigation measures without evidence supporting their feasibility*, the Divisional Court found in favour of the residents. As noted by the court, and conceded by *Dewdney*, a zoning by-law amendment conditional on a Haul Route Agreement being executed by "relevant parties" would not ordinarily encompass private land owners, whose land cannot be used by *Dewdney* to mitigate *adverse impacts* outside of the lot limits of the proposed quarry, without the consent of the impacted property owners. On this one issue, the case was sent back to the OMB.

At the OMB hearing that followed,<sup>11</sup> it was acknowledged that the Board previously hearing the case "failed to appreciate that the ARA will not permit...issuance of an aggregate extraction license unless and until the lands for which it is to be issued are actually zoned, by an in-force by-law, to permit aggregate extraction." In addressing the issue of *noise mitigation*, ultimately 9 sensitive receptors were identified along the proposed haul route that would experience unacceptable levels of noise, and there was consensus to recognize the hunting camps as sensitive receptors.

*The parties agreed that the core issue in this hearing was the potential for adverse impact on the residential dwellings fronting on Ledge and Quarry Roads from the noise created by trucks using the portion of the proposed haul route on Ledge and Quarry Roads [para. 36], [and]*

*[That] the Appellants...contend that the increased noise, dust and heavy truck traffic will have an unacceptable adverse impact both on their property values and on their quality of life [para. 37].*

Consequently, some form of mitigation is required in order to comply with section 2.5.2.2 of the Provincial Policy Statement,

*which declares that extraction shall be undertaken in a manner which minimizes social, economic and environmental impacts, and...[which] compl[ies] with the applicable noise guideline documents published by the Ministry of the Environment...[para. 32].*

<sup>10</sup> *Eastman, Johnson, Klein and Pillsworth v. Dewdney Mountain Farms Ltd.*, 2017 ONSC 5749 (CanLII), <<http://canlii.ca/t/h6fbf>>, retrieved on 2020-01-15.

<sup>11</sup> *Anderson v Trent Lakes (Municipality)*, 2018 CanLII 35131 (ON LPAT), <<http://canlii.ca/t/hrnfd>>, retrieved on 2020-01-15.

But for the proposed quarry use, heavy quarry trucks would not be on Ledge and Quarry Roads, and without a means of access for heavy trucks to haul aggregate the proposed quarry cannot function. In the initial mitigation proposal submitted by Mr. Hofbauer, the applicant's acoustical engineer,

*it appears that what was then contemplated in the way of mitigation was the emplacement of earth berms and noise walls atop them, to be strategically placed along Quarry Road and Ledge Road so as to attenuate the sound energy which would be experienced at the various sensitive receptors and bring that sound energy down below the recommended maxima.*

It became evident that the ill-defined, impractical and presumptuous nature of this conceptual mitigation measure, dependent on the property rights of others, was not acceptable to the impacted property owners along the proposed haul route:

*...[I]n order to implement such a feature, it may be necessary to enter upon the private property to be protected in order to create a portion of the berm....[T]he Tribunal...[was advised] that the owners of the affected properties are not prepared to grant the necessary consent for such entry and works. Therein lay the issue of feasibility [para. 34].*

*The Appellants are of the view that they are entitled to legitimate protection that can and will be implemented. They should not have to take on faith that some means will be determined to shield their properties. They should have the benefit of a detailed plan so that all of the ramifications of the proposal can be assessed [para. 35].*

A new mitigation plan submitted by the acoustical engineer would have resulted in an uninviting barricading effect on the properties of the impacted owners:

*The new scheme would create a noise attenuation barrier in the form of armourstone walls which would be located wholly within the road allowance. These would be supported by earth berming on Ledge Road. In order to have room to accommodate these works wholly within the road allowance, the road would have to be reconstructed away from the affected private properties and off-centre of its current location, which the Tribunal understands to presently be generally centred on the road allowance. For those properties on Quarry Road, due to the location of sensitive receptors on both sides of the road, and due to the resultant physical constraints which arise from that in terms of realigning the road, in lieu of earth berming, gabion works are suggested to provide the necessary support for the armourstone walls [para. 39].*

*The armourstone walls would be constructed in layers or courses, each approximately 1 metre...in height. The table by Mr. Hofbauer indicated various proposed heights to achieve the necessary mitigation at each particular location. The heights run from a low of 2.5 m [8.2 feet] to a high of 4 m [13.12 feet]. Thus, at certain locations, the armourstone wall would be three layers [9.84 feet] and in others four [13.12 feet] [para. 40].*

Mr. Hofbauer acknowledged that there would have to be breaks in the armourstone walls where the property owners' driveways are located, at which points there would be an increase in the decibel level, something not apparent in the engineer's calculations. He acknowledged not working from final road designs, and that his sound mitigation values were only theoretical. Further, there was no agreement in place with the Town that would allow for the works contemplated by the acoustical engineer. The shortcomings of this ill-conceived mitigation plan are readily apparent:

- an increase of 1 decibel at each opening (driveway) would in every case exceed the recommended noise limit
- adequacy of sight lines to ensure safe movements from the driveways resulting from 3-metre (9.84 feet) to 4-meter (13.12 feet) high walls set within the abutting road allowance
- no indication of how the presence of the walls would affect snow removal
- no provision for the location of utility poles
- no provision for drainage swales or other means of storm drainage

In short, none of the affected property owners would know the precise features of the noise mitigation abutting their property and, therefore, are not able to assess the impacts of those features on the use and enjoyment of their property.

Furthermore, it is highly improbable that the provision for utility poles and drainage swales (or other means of storm drainage) as part of the conceptual mitigation plan could be achieved without expropriating land from the impacted property owners along the proposed haul route, a power not available to a private for-profit corporation or entity. In rejecting the conceptual nature of the proponent's mitigation plan, and setting aside the Zoning Amendment, the OMB found that,

*The evidence tendered by the Proponent...falls well below the standard necessary to satisfy the Tribunal that the required noise mitigation works are feasible and capable of implementation so as to achieve the required noise attenuation objectives and also not creating ancillary undue impacts either as such impacts may relate to the functioning of the road itself or the use and enjoyment of the properties abutting thereon [para. 58].*

*Having come to the conclusion that there is insufficient evidence at the present time to be assured that there will be efficacious noise mitigation to the affected sensitive receptors on Ledge Road and Quarry Road, and that policy compliance requires such assurance, the Tribunal cannot, in the public interest, authorize the use of the Site for quarry purposes [para. 60].*

While the OMB ruled in favour of the property owners, the decision does not address the likely costs of the works associated with the noise mitigation measures, the cost of maintaining the haul routes, exposure to dust and exhaust fumes from truck traffic and potential health risks, increase in traffic and potential fatalities, ground vibrations from truck traffic, and the likely diminution in the value of the impacted properties, accompanied by a reduction in the Town's tax base. Under the Ontario *Municipal Act, 2001*, municipalities enjoy broad powers as to the manner in which they govern their affairs and over issues that impact property and persons within their municipal boundaries:<sup>12</sup>

- Section 9 of the *Municipal Act, 2001* provides that a Municipality has the capacity, rights, powers and privileges of a natural person for the purpose of exercising its authority under this or any other Act.
- Section 8 of the *Municipal Act, 2001* provides that the powers of a Municipality under this or any other Act shall be interpreted broadly so as to confer broad

---

<sup>12</sup> For example, see Public Nuisance By-law PH-18, Bill No. 228, 2012 – Consolidated as of August 27, 2019, City of London, <https://www.london.ca/city-hall/by-laws/Documents/public-nuisancePH18.pdf>.

authority on municipalities to enable them to govern their affairs as they consider appropriate, and to enhance their ability to respond to municipal issues.

- Section 10 of the *Municipal Act, 2001* provides that a Municipality may pass by-laws respecting: Economic, social and environmental well-being of the Municipality; Health, safety and well-being of persons; Protection of persons and property; Structures, including fences and signs.
- Section 128 of the *Municipal Act, 2001* provides that, without limiting sections 9 and 10, a local Municipality may prohibit and regulate with respect to public nuisances, including matters that, in the opinion of Council, are or could become or cause public nuisances, and the opinion of Council under this section, if arrived at in good faith, is not subject to review by any court.

In *Bowen et al. v. Bedford et al.*,<sup>13</sup> there was a dispute as to whether a *limestone quarry* is a permitted use in an *RF-Rural* zone, as well as on all zoned land in the City of Saint John. The majority of the New Brunswick Assessment and Planning Appeal Board (NBAPAB) sided with the City (Development Officer), which recognized a limestone quarry as a permitted use both under the *RF Rural* zoning, as well as in all zones.

However, the minority opinion rejected the majority view that, implicitly, limestone quarrying is permitted in all zones, distinguishing limestone quarrying as a *main* use, unlike the kind of *grading, excavation for a basement or swimming pool, work performed by a public utility or the construction, repair or alteration of streets*, which are either incidental to the main use of the land or necessary for the public good. Moreover, the majority's view runs counter to the theory behind zoning and the issue of land compatibility, with the welfare and stability of the community taking priority over profit maximization of an individual's or corporate entity's desired use of land.

*Commercial limestone quarrying...is the main use of the land and is also a private undertaking which, in my opinion, places it in a separate category from the other types of excavation listed in Section 880(2). These factors make it a very different type of excavation and not one which I would imagine Council intended to be permitted in every zone. If they did, they should have been more specific in saying so.*

*The **necessity** for allowing the other types of excavation in any zone is self-evident. Such is not the case with respect to commercial limestone quarrying in my opinion. I am fortified in this conclusion by the fact that it is specifically made subject to terms and conditions which the PAC may impose and in fact it may even be prohibited by the PAC. Excavations for streets, foundations and swimming pools are not conditional uses, nor may they be prohibited by the PAC under any circumstances.*

*The **Community Planning Act** provides in **Section 34(4)(c)** that a zoning by-law may prescribe particular purposes for which land, buildings and structures in any zone may be used in respect of which the PAC may impose terms and conditions or, alternatively if, in the PAC's opinion, compliance with the terms and conditions cannot reasonably be expected the PAC may prohibit the use. These uses are known as conditional uses. An example may be found in Section 720(1)(b) as set out in Schedule "B" hereto.*

*The Act also provides in Section 35(a) that if, in the opinion of the PAC, a use which is otherwise not permitted under the zoning by-law is sufficiently similar to or compatible with any use which is*

---

<sup>13</sup> *Bowen et al. v. Bedford et al.*, 1992 NBAPAB 20 (CanLII), <<http://canlii.ca/t/26cpw>>, retrieved on 2020-01-12.

*permitted in the zoning by-law, then that similar or compatible use may be permitted by the PAC subject to terms and conditions.*

*These provisions of the Act and the by-law which allow the PAC to impose terms and conditions on uses also envision a determination of compatibility with uses in the affected zone. With respect to the conditional use, the compatibility aspect presumably has been considered by Council when the by-law was passed. With respect to the similar use, the Act contemplates the PAC determining the compatibility issue.*

*Section 40(2) of the zoning by-law also authorizes the PAC to allow a development otherwise prohibited by the by-law for a temporary period not to exceed one year subject to terms and conditions. This too allows for consideration of the compatibility issue which, in my opinion, is so central to the concept of zoning, before approval is given.*

***If commercial limestone quarrying or any main use were allowed by necessary implication in any zone, as suggested by the respondent, then the compatibility factor would be overlooked and in my opinion, that would be contrary to the whole theory of zoning. [emphasis added]***

The minority cites Roger's description of *zoning* in *Corpus Juris Secundum* at pages 115-116, as

...the regulation by districts of the building development and uses of property, and its essence is a territorial division according to the character of lands and structures and their peculiar suitability for particular uses, and the uniformity of use within the division.

Zoning is a deprivation for the public good of certain uses by owners of property to which the property might otherwise be put. Underlying planning statutes is the principle that the interest of landowners in securing the maximum value of their land must be controlled by the community.

The theory of zoning is that each district is an appropriate area for the location of certain uses which the plan designates, and the existence or entrance of other uses will tend to impair the development and stability of the area for the appropriate uses. The objective of zoning must be considered from the standpoint of the public welfare and of all the property within any particular use district.

Applications for new quarries in Ontario<sup>14</sup> ought not to be approved and expansion of existing quarries denied if a quarry operation cannot be adequately setback *inside* the boundary limits of the property and guaranteed to:

- *avoid conflict and incompatibility with existing sensitive land uses,*<sup>15</sup>

---

<sup>14</sup> In Ontario, permits and licenses are issued by the Ministry of Natural Resources and Forestry (MNRF) pursuant to the [Aggregate Resources Act](#), R.S.O. 1990, c. A.8. A listing of all licenced/permitted pits and quarries in Ontario and a number of related resources can be downloaded from the government's website: <https://www.ontario.ca/rural-and-north/aggregate-resources-policies-and-procedures>. For a detailed analysis of the aggregate industry in Ontario see Estair Van Wagner's 2017 dissertation: [https://yorkspace.library.yorku.ca/xmlui/bitstream/handle/10315/35453/Van\\_Wagner\\_Estair\\_S\\_2017\\_PhD.pdf?sequence=2&isAllowed=y](https://yorkspace.library.yorku.ca/xmlui/bitstream/handle/10315/35453/Van_Wagner_Estair_S_2017_PhD.pdf?sequence=2&isAllowed=y).

<sup>15</sup> "**Sensitive land uses:** means buildings, amenity areas, or outdoor spaces where routine or normal activities occurring at reasonably expected times would experience one or more *adverse effects* from contaminant discharges generated by a nearby *major facility*. *Sensitive land uses* may be a part of the natural or built environment. Examples may include, but are not limited to: residences, day care centres, and educational and health facilities. [p. 48]" *Provincial Policy Statement*, 2014. <http://www.mah.gov.on.ca/AssetFactory.aspx?did=10463>.

- *not endanger the health and safety of the public,*<sup>16 17</sup>
- *not endanger wildlife and livestock,*<sup>18 19</sup>

<sup>16</sup> “An air quality index (AQI)...[measures] current air status and is used to forecast how it becomes....As the AQI increases, an increasingly large percentage of the population is likely to experience increasingly severe adverse health effects....Blasting and crushing of crystalline rocks generates dust (particulate matters) presence in the immediate and nearby environment. This alters the ambient air quality with its attendant geohazards such as visual impairment, noise, segmental vibration, heat, changes in barometric pressure and ionizing radiation...[and] water pollution is exacerbated due to dust generated by quarry activities....Suspended particulate matter is quite outstanding among all pollutants emanating from quarrying operations...There is a clear connection between exposure to the dust and diseases, where exposure to silica dust during stone crushing in quarries carries the risk of development of silicosis, progressive massive fibrosis, asthma, chronic obstructive pulmonary diseases, and airway obstruction in exposed workers [p. 1828].” <https://www.ijser.org/researchpaper/Estimation-of-Air-Quality-Status-due-to-Quarrying-activities-and-its-Impacts-on-the-Environment-and-Health-of-the-People.pdf>.

<sup>17</sup> In 2014, Oxford County Public Health conducted a survey of Beachville area residents as to *perceived air quality*. A total of 103 self-administered surveys were completed, and almost 72% of respondents reported air quality in Beachville area as “poor” or “very poor.” On the open-ended portion of the survey, comments confirmed frustration with “the lack of commitment to the *Source Emissions Monitoring Program* demonstrated by quarry operations, namely, Carmeuse, LaFarge, and Federal White, and...disappointment with the Ministry of the Environment and Climate Change for creating the program then failing to enforce it.” As to the impact of air quality on health, 34.9% indicated that their health or the health of a family member had been affected and 16.0% said no, while the remaining 49% didn’t know/not sure or did not respond. In rating the air quality as “poor,” 15 respondents referenced “visible air pollution, dust, clouds blowing across the road, and respiratory symptoms upon acute exposure to air in the area.” Another 29 responses indicated “Poor Health Outcomes,” with the majority alluding to “respiratory conditions, such as asthma, chronic obstructive pulmonary disease (COPD), emphysema, and lung disease. Non-respiratory chronic conditions were also reported, including multiple sclerosis, cardiovascular disease, and chronic headaches. A long history of allergies and non-specific symptoms, such as sore, itchy eyes; congestion; cataracts; coughing; shortness of breath, and increased phlegm production was reported to affect the lives of several respondents and their families.” Although not asked to identify the factors contributing to air quality, 12 respondents “pinpoint[ed] local quarries as a source of poor air quality in the region, thereby, impacting on human health.” [emphasis added]

<http://www.oxfordcounty.ca/Portals/15/Documents/SpeakUpOxford/2015/Beachville/Citizen%20Survey%2020150206.pdf>. See also audio presentation of final report on Beachville area air quality report: <http://www.oxfordcounty.ca/Your-Government/Speak-up-Oxford/Campaign-Details/ArticleId/5648/2016-DRAFT-Beachville-area-air-quality-assessment>.

<sup>18</sup> “**Adverse effects:** as defined in the *Environmental Protection Act*, means one or more of: impairment of the quality of the natural environment for any use that can be made of it;...[p. 38]” *PPS*, 2014. For example, see “Endangered species protection and evidence-based decision making: Case study of a quarry proposal in endangered turtle habitat,” *Global Ecology and Conservation* (Volume 20, October 2019) <https://www.sciencedirect.com/science/article/pii/S2351989419303555?via%3Dihub>.

<sup>19</sup> Endangered Species Act, 2007, as amended, which “takes note of the precautionary principle,” <https://www.ontario.ca/laws/statute/07e06>. See also Species at Risk Act (S.C. 2002 c. 29) <https://laws-lois.justice.gc.ca/eng/acts/s-15.3/>.

<sup>20</sup> In rejecting JDCL's proposed (blasting below the watertable) quarry, section 12(1)(k) of the ARA required the Board to have regard to "such other matters as are considered appropriate," it must have regard to the cost of mitigation measures and who will bear the costs of them. The Board is cognizant of the fact that all parties have agreed that an unmitigated quarry is inappropriate for the site. The Board would go further to find such an unmitigated quarry would, without a doubt, result in a catastrophe for water dependent natural heritage features and functions around the site...[F]rom all the evidence adduced by all the parties...the only thing standing between the proposed quarry and a catastrophic impact on the environment is the AMP [Adaptive Management Plan]. Therefore the Board must be convinced that the applicant would have the resources to complete all that is required by the AMP ...[In 2003], the present value of those costs was in the range of \$80 million to \$90 million...[and] that over time, if it was spread out, it would be much more. The Board finds that no public authority, not the Province, the Region, the Town, nor the CVC should ever find itself responsible for the costs of mitigation measures for the proposed quarry...[The] complex, highly engineered closely monitored mitigation system...would have to operate effectively for approximately 80 years [p. 72-73] OMB Decision Nov. 12, 2010 (PL000643 and PL060448) <http://gravelwatch.org/wp-content/uploads/2016/03/OMB-Rockfort.pdf>. [emphasis added]

<sup>21</sup> Southern Ontario has lost over 72% of its wetland cover, of which aggregate extraction accounted for 6% of the total loss during the period of 2000 to 2010. "Wetlands can store water, acting like a sponge during wet periods and gradually recharging groundwater, which in turn replenishes soils and streams across the larger landscape. Wetlands provide critical reservoirs during storms and heavy rains, protecting us from the worst impacts of floods. Wetlands can stabilize shorelines and control erosion, protecting both the land and water quality. They purify water by filtering out nutrients, sediments and pollutants from groundwater and surface runoff before discharging it to other water bodies. Wetlands also provide habitat for many species of plants and animals, including an estimated 20% of Ontario's species at risk [footnote omitted]. For all these reasons, both the federal and provincial governments have recognized that conserving and enhancing wetland habitat is vital for supporting Canada's actions to sustain biodiversity [sec. 1.1.2]," The cumulative impacts of human activities through repeated and multiple disturbances have led to greater wetland loss or degradation than any threat on its own. "The fate of individual wetlands is often determined on a case-by-case basis, and overall wetland cover is declining due to a slow death by a thousand cuts [sec. 1.2.1]." MNR released a Wetland Conservation Strategy in 2017 containing 67 promised actions including halting of net loss of wetland area and function by 2025, and achieving a net gain of wetland area and function by 2030, both in areas where wetland loss has been greatest, with reports published every five years, beginning in 2020 (sec. 1.3). Wetlands should be identified as significant until proven otherwise. "Various stakeholders have suggested taking such a **precautionary approach**: treat all wetlands in southern Ontario as provincially significant until proven otherwise," placing the "burden on the company or person who wants to interfere with a wetland [Chapter 1, p. 23]." [emphasis added] *2018 Environmental Protection Report*, Environmental Commissioner of Ontario. <https://docs.assets.eco.on.ca/reports/environmental-protection/2018/Back-to-Basics-Volume4-Ch1.pdf>.

<sup>23</sup> Ibid p. 3.

<sup>24</sup> PPS Section 1.1.1(c) states that "Healthy, liveable and safe communities are sustained by...avoiding development and land use patterns which may cause environmental or public health and safety concerns.

<sup>25</sup> Adjoining land zoned or designated to permit legal uses that would be precluded if a new quarry were permitted or an existing quarry were allowed to expand—a de facto taking of land without compensation.

- preclude reduction in value of neighbouring properties,<sup>26 27</sup> and
- preclude cumulative effects.<sup>28</sup>

As blasting is the most dangerous aspect of operating a quarry, a generous *setback* is essential to protect workers and the general public. When establishing setbacks from populated areas or human activity, the setbacks should reflect a worst case scenario, and allow for human error (overloading with explosive and mistakes in blast design<sup>29</sup>) and the unpredictability of flyrock. According to expert testimony presented during the Ministry of Environment's (MOE) investigation of two flyrock incidents in July 2009 at Pakenham Quarry, near Arnprior,<sup>30</sup>

*Any experienced blaster would have had the same fly rock incident take place." "There is no technology to identify anomalies in rock such as mud seams or voids." "90% of all fly rock incidents are unexplainable." "[The expert] advised 'that the hazard zone [for Pakenham Quarry] be increased to 500 m when firing any future blasts...'*

Concerns expressed over the danger of *Flyrock* are posted on New England Laborers' Health and Safety Fund's website:<sup>31</sup>

***Blasting can be much more dangerous than you think. Even if you are thousands of feet away from the blast, you can still be hit by debris from the blast. This debris is called Flyrock. [emphasis added] Flyrock can travel at high speeds and very far from the blast area. It can easily pierce a windshield or even the metal of a truck.***

<sup>26</sup> In *Lambrecht v. County of Will*, 217 Ill. App. 3d 591 (Ill. App. Ct. 1991, 577 N.E.2d 789, while upholding the trial court's ruling to deny a quarry permit, agreed with the plaintiff's position that "restrictions of the use of property cannot be justified by the mere *desires* of neighbors or their *belief* that property values will be affected. However, the diminution of property values within a neighborhood is a proper factor for the trial court to consider. (See *La Grange State Bank*, 75 Ill.2d at 309, 388 N.E.2d at 391; *Amalgamated Trust Savings Bank v. County of Cook* (1980), 82 Ill. App.3d 370, 382, 402 N.E.2d 719, 727 ('[t]he rights of adjacent and abutting property owners are to be considered') Moreover, regardless of the merits of the distinction drawn by Gorte between people who build their homes near existing quarries and those who buy their homes and "then have a quarry put in [their] back yard," there is nothing in the record to suggest that the trial court based its decision on, or was even influenced by, a similar concern." <sup>31</sup> <http://www.nelhsf.com/nelhsf-library/safety/flyrock/>.

*Here is an example of an incident that occurred in West Virginia. A worker thought he was safely seated in the cab of his truck about 2000 feet [610 metres] from the blast, when all of a sudden he saw flying rocks propelling toward him. Luckily, he was able to duck below the dashboard and was not injured. A rock, the size of a football entered the front of the windshield, traveled where his head would have been and exited the back. Other rocks in the cloud dented the truck. If any of the flying rocks would have hit the driver, he could have been killed. The furthest rocks from the blast flew about 6000 feet [1,829 metres].*

*Laborers can be exposed to the dangers of Flyrock while working in/on or around a blasting operation. Flyrock can affect both construction workers and bystanders. Flyrock is one of the major causes of blasting-related injuries.*

*Flyrock can result in critical injuries or even fatalities. Flyrock is also a frequent cause of damage to equipment and facilities.*

On January 23, 2018, in response to a number of serious injuries suffered by miners as a result of premature blast, the Mine Safety and Health Administration (MSHA) issued a safety alert<sup>32</sup> addressing the dangers of flyrock:

***MSHA recommends that Blast Area should as a minimum be one and a half times the furthest distance that any previous fly rock has travelled.*** [emphasis added]

*Blasting is a serious and potentially dangerous practice on a mine site due to the use of explosives, and it is difficult to determine the specific trajectory of fly rock during a blast.*

Previously, on March 24, 2016, the MSHA expressed the following concerns about flyrock:<sup>33</sup>

*Flyrock – the fragments of rock thrown and scattered during blasting – is responsible for a large proportion of all blasting-related injuries and fatalities. Flyrock is a potential hazard anytime and anywhere there is blasting.*

According to *Eloranta*, who was responsible for revising the International Society of Explosives Engineers (ISEE) Handbook chapter on open pit and quarry operations, it is unethical to disregard public safety and to accept flyrock as inevitable:

*[A]nyone involved in blasting is obligated to place safety above all other considerations, according to Eloranta. Even if blasts that launch life-threatening rocks into populated areas are rare, even if no one is injured, accepting that as inevitable is unethical.*<sup>34</sup>

A blaster-training module<sup>35</sup> funded by the Office of Technology Transfer, Western Regional Office, Office of Surface Mining, U.S. Department of the Interior points out the potential for severe adverse impacts from flyrock:

*[Flyrock is] The Single Factor Of Surface Mining That is Most Likely to Cause A Fatality!!! [p. 57]*

*Flyrock is the single most dangerous adverse effect that can cause property damage and personal injury or death [p.4]. Flyrock is the number two killer in mining operations [p.60].*

<sup>35</sup> <https://www.osmre.gov/resources/blasting/docs/WYBlasterCertModules/8AdverseEffectsBlasting.pdf>.

As reported in the June 2013 issue of the *NRIAG Journal of Astrophysics and Geophysics*,<sup>36</sup> the damage caused by flyrock is both undesirable and self-evident:

*Fly rocks are considered to be the most undesirable movement of rocks during the blasting activities. Damage by a fly rock can not be refuted; the evidence is usually present and visible [p. 103].*

As reported in the 2014 issue of the *Journal of Rock Mechanics and Geotechnical Engineering*,<sup>37</sup> flyrock is an inevitable consequence of quarry blasting and can never be entirely eliminated:

***Due to the explosive force, rock fragments are propelled and thrust high into the air and beyond the safety limit of blast area, thus termed as “flyrock”. This is mainly due to the flaws presented in the blast design and also due to the misinterpretation of rock mass behavior. The phenomena of flyrock are always uncontrolled and can never be brought down to zero [p. 447]. [emphasis added]***

In the United Kingdom, over a five-year period, where incidents of flyrock had been reported and documented, cumulatively 100% of the flyrock incidents occurred within 800 metres of the blast site, as summarized by Hill.<sup>38</sup>

Distance from blast (m)	Number of incidents	Percent of total	Cumulative %
100	17	20	20
200	22	26	46
300	25	29	75
400	7	8	84
500	8	9	93
600	2	2	95
700	3	4	99
800	1	1	100
<b>total</b>	<b>85</b>	<b>100%</b>	

As reported in an August 5, 2013 news release issued by the publication “Quarry,”<sup>39</sup> in response to a 2011 flyrock incident at Brayford Quarry, the UK *Health and Safety Executive* (HSE) said that,

<sup>38</sup> William Hill, “Dangers Proposed To Highway 7 By Hidden Quarry Flyrock,” p.7, William Hill Mining Consultants Ltd, 2013, <http://sg.crcrockwood.org/wp-content/uploads/2017/01/HQ-Flyrock-Dangers-ref.-Highway-7.pdf>.

<sup>39</sup> <https://www.quarrymagazine.com/Article/3260/Quarry-blast-goes-drastically-wrong>.

***With 3,250 injuries, including 27 fatalities, since 2000, quarrying in the UK remained one of the most dangerous industries to work in. [emphasis added]***

A previous study of flyrock undertaken by HSE between 1981 and 1988, found that 17% of reported (known) flyrock incidents could not be explained:

***Although blast design is the primary protection against flyrock, only 83% of the 154 incidents investigated by the UK Health & Safety Executive (HSE) between 1981 and 1988 could have been prevented by blast design (HSE, 1989). This leaves some 17% that arose from unpredictable causes [p. 182]<sup>40</sup> [emphasis added]***

Quarry operations in Malaysia are branded as *heavy industry*, requiring a minimum buffer zone of 500 metres from the intended blasting area to the nearest residential or industrial area (Environmental Requirements: A Guide to Investors 2010, Appendix G). Even this setback requirement proved inadequate when a tragic blast on July 19, 2013 at Masai quarry propelled flyrock up to 700 metres away, with devastating consequences:

***The massive explosion caused rocks and boulders to rain down on the nearest industrial park...which is 700 metres from the site....[A] factory worker was killed, 10 people were injured, 18 cars and 14 factories were damaged [p. 1584].<sup>41</sup> [emphasis added]***

A brochure<sup>42</sup> produced by the mining and quarrying companies of Nova Scotia as an effort to assure the public that blasting does not have an adverse effect on neighbouring properties alludes to the fact that,

*[All] regulated blasting buffers in Nova Scotia are 800 metres, [making] the risk to groundwater or anything else...extremely low.*

According to *Blanchier*,<sup>43</sup> the risk and adverse effects of flyrock associated with quarry blasting is seldom or properly addressed as part of the investigations and studies undertaken in support of an application for a licence to permit quarry operations, even though flyrock is considered a greater hazard than vibrations or airblast:

*Accidental flyrock in blasting operations has a major impact on the external environment...due to the hazards involved and is more significant than vibrations or airblast....[E]ven if it is normal practice in these zones to take into account the impact of possible vibrations and even the effects of airblast when modeling the project, flyrock risks are not dealt with in initial studies, other than by way of integrating general safety distances. These risks are only sometimes taken into account much later in the operation and most often, following an accident or significant flyrock being recorded externally [off-site] [p. 549].*

<sup>43</sup> A. Blanchier, "Quantification of the levels of risk of flyrock," Rock Fragmentation by Blasting: The 10th International Symposium on Rock Fragmentation by Blasting, 2012 (Fragblast 10); Leiden: 549-553.

According to *Bhandari and Jain*,<sup>44</sup> there is considerable variability in the distance that flyrock can travel, and even the best designed blast can generate flyrock, and in 1982 The Director General of Mines Safety India recommended setbacks be increased from 300 metres to 500 metres:

*Flyrock can still be generated even in the best-designed blast. Flyrock distances can range from zero for a well[-]controlled mine blast to nearly 1.5 km for a poorly confined large, hard rock mine blast and many fatalities have occurred. In a circular, The Director General of Mines Safety India in 1982 had recommended that personnel be removed up to 500 m, though previous limit was 300m only. Thus, where large diameter blasting is carried in hard rock mining, extra precautions are required to control the flyrock damages in the surroundings [p. 6].*

According to *Raina et al*,<sup>45</sup> the research on flyrock is “abysmal,” due to under- or non-reporting of flyrock incidents and to the high costs of experimentation, and flyrock arising from open pit blasting continues to confound rock excavation engineers:

*Flyrock, arising from open-pit blasting, still eludes rock excavation engineers, despite a reasonable understanding of throw [p. 660].<sup>46</sup>*

*Despite the fact that flyrock consumes only 1% of the explosive energy used in a blast,<sup>47</sup> it is more serious in nature, in comparison to ground vibrations, as it can inflict damages, injuries and fatalities. Several authors have reported that 20–40% of the blasting related accidents are due to flyrock.<sup>48</sup> The research on flyrock is, however, abysmal<sup>49</sup> and considering the above-mentioned facts, the problem deserves more attention from the researchers.*

*Hence, it is essential to identify the reasons for lack of R&D on flyrock. Under or non-reporting of flyrock<sup>50</sup> probably due to heavy penalties imposed by regulatory agencies, high cost of experimentation, and the random nature of flyrock are some of the reasons identified for inadequate R&D on flyrock. Such limitations are the cause for low confidence with regard to the existing predictive models of flyrock distance.*

<sup>50</sup> Davies, P. A., “Risk based approach to setting of flyrock danger zones for blasting sites.” *Trans. Inst. Mines Met.*, May–August 1995, 96–100.

*One of the downers in flyrock prediction is its random nature, as one cannot generate a flyrock and need to rely on chance...Since flyrock is a potential threat to property and life, one cannot risk under-prediction [p. 661].*

A failure to report or under-report flyrock incidents are major environmental and safety concerns shared by the European Federation of Explosives Engineers (EFEE), as expressed in its December 2016 Newsletter:<sup>51</sup>

*The work of the EFEE's Environment Committee has shown in the last few months that it is still very difficult to obtain feedback about [flyrock] incidents or accidents occurring during blasting operations.*

*Although everyone agrees that this feedback is fundamental for preventing probable future incidents and therefore for risk management, the incidents and their causes are still badly indexed. However, civil society, elected officials and especially residents, increasingly demand that these [flyrock] incidents be accounted for by public authorities, companies, and sometimes request information directly via the press or television.*

*Over and above dealing with a specific incident, preventing flyrock risk requires that this aspect of the environmental impact of blasting be explicitly integrated into blaster and blasting training, as well as into regular meetings on work safety organized in accordance with labour legislation.*

Flyrock is a public safety issue, and setback requirements should not be reduced in favour of economic interests of the aggregate industry over the health and safety of the public. A mandatory setback of 800 metres from any sensitive land use (or activity) or settlement area<sup>52</sup> imposed on a proposed blasting quarry or existing blasting quarry expansion would virtually eliminate the potential adverse impacts of flyrock. Blasting below the water table has numerous known adverse environmental impacts, warranting a greater setback, and karst terrains should be avoided.<sup>53</sup>

<sup>51</sup> EFEE Newsletter, December 2016, <https://efee.eu/wp-content/uploads/2016/12/2016-12-EFEE-Newsletter-3.pdf>.

<sup>52</sup> **Settlement areas:** means urban areas and rural settlement areas within municipalities (such as cities, towns, villages, and hamlets) that are built up where development is concentrated and lands which have been designated in an official plan for development over the long-term horizon provided for in policy 1.1.2. (PPS). Where land in *designated growth areas* is not available, the *settlement area* may be no larger than the area where development is concentrated (p. 48, 2014 Ontario Provincial Policy Statement).

<sup>53</sup> **Karst:** Terrain composed of or underlain by carbonate rocks that have been significantly altered by dissolution (i.e., the process in which a solid or liquid becomes dissolved in ground water). See "A glossary of Hydrological Terms," Department of Geological Sciences, University of Texas, 2007. <http://www.geo.utexas.edu/faculty/jmsharp/sharp-glossary.pdf>. See also *Southern Ontario Karst map*, Ontario Geological Survey (Brunton and Dodge, 2008), <http://www.geologyontario.mndm.gov.on.ca/mndmfiles/pub/data/imaging/GRS005//karst-map.pdf>.

## ***NO AMOUNT OF FLYROCK IS ACCEPTABLE***

According to *Eloranta*,<sup>54</sup> (former) vice-president for technical matters for the International Society of Explosives Engineers (ISEE), there is no practical economic way of preventing flyrock impacts from quarry blasting:

*"Really, flyrock is intolerable." Any amount of flyrock is unacceptable. You lose control of the process at that point," said Eloranta. "Speaking generally, Eloranta said flyrock doesn't automatically suggest an excessive amount of explosives had been used. "Explosives doesn't equal flyrock," he said."*

*Proper design of the blast is critical, ensuring that there's enough distance between the columns of explosives at the bottom of drill holes and the sheer edge of the shelf of rock. That's known as "burden," and it keeps the force of the blast from launching rocks from the shelf face. The material above where the explosives are placed, called "stemming," is equally important to keep flyrock from being ejected vertically from the blast.*

*The force of an explosion is going to seek a path of least resistance, Eloranta said. If the design is done correctly, there is no path of least resistance. The power of the blast simply does its job of pulverizing the rock and shifting it slightly away from the face of the shelf.*

*A fault in the rock, if unknown to the explosives engineer, can provide a path for that explosive energy that can mess up an otherwise well-designed blast, he said. "The same amount of energy in there can just launch those materials."*

*Caution can be costly. It's not accurate to suggest that the presence of faults and seams in a section of rock is unknowable, though. Enough geologic testing could identify those problem areas. But there's an economic issue with that solution. "The cost of the testing would exceed the value of that product," Eloranta said...*

*[A]nyone involved in blasting is obligated to place safety above all other considerations, according to Eloranta. Even if blasts that launch life-threatening rocks into populated areas are rare, even if no one is injured, accepting that as inevitable is unethical.*

*"To say 'It might happen again, there's nothing we can do about that,' well, nobody buys that," he said.*

*The options, really, are only two in Eloranta's mind: Don't blast in a location that threatens public safety or adopt the safety measures required, regardless of the price, that meet the challenges Mother Nature has put in place.<sup>55</sup>*

---

<sup>54</sup> *Eloranta* has 29 years of blasting experience, has degrees in mining and geology, has a master's degree in mining, has authored more than 20 papers on mining and blasting, and revised the ISEE Handbook chapter on open pit and quarry operations. In 2004, he was awarded the President's Award by the society for meritorious service to the explosives industry. In 2005, he was elected to the board of directors for the ISEE. *Eloranta & Associates Inc.* website: <https://elorantaassoc.com/about-us/>. He is also a past President of ISEE.

## ***Excessive Airblast and Ground Vibrations Can Cause Flyrock***

Only 20 to 30 percent of the energy produced in quarry blasting is utilized to fragment and move rock mass. The remaining energy is wasted to create unwanted environmental impacts. Often, the factors that cause excessive airblast and ground vibrations have the potential to cause flyrock as well.

### **Characteristics of Flyrock**

*Flyrock involves the uncontrolled propelling of rock fragment produced by blasting. Institute of Makers of Explosives (IME) has defined flyrock to distinguish it from blast area accident. It is defined as the rock propelled beyond the blast area by the force of an explosion.<sup>56</sup> These rocks can travel distances of more than 600 m at speeds of up to 650 km/h.<sup>57</sup>*

*Flyrock comes in different sizes and shapes, ranging in mass from few ounces to several tons. Persson et al. [1994] referenced flyrock weighing approximately three tons thrown to a distance of 980 ft. [299 m].*

*Fly rock can be cast thousands of feet from a blast. The most dangerous source is ejection from a crack or weak zone in the highwall face where gases violently vent. This action is akin to a rifle where the expanding gases eject a projectile. Frequently the ejection of stemming out of the top of a blast hole is called rifling.<sup>58</sup>*

*Flyrock is unpredictable and dangerous. Flyrock can travel in any direction or multiple directions from a blast.<sup>59</sup>*

*A rock that lands harmlessly in a field may not appear to be a large issue. However, mowing and tilling become hazardous when rock is struck by farm equipment. Rock through timber stands mar trees and potentially impact the market value.<sup>60</sup>*

*In areas of steep slopes, a rock set in motion by the explosive energy may roll hundreds of feet. In this instance the rock rolled through a trailer down slope from the mine. Children were playing in the front yard at the time. Fortunately no one was injured.<sup>61</sup>*

*Any size material is capable of damaging property or injuring people.<sup>62</sup>*

*...Where blasting causes the discharge of a contaminant, such as fly-rock, into the natural environment, blasting may harm people, animals or property. This is what happened in this case. A blasting activity gone wrong (as the appellant concedes) may not have caused more than trivial or minimal harm to the air, land or water. However, the fly-rock generated by the blasting did cause significant harm to property, a different adverse effect under the Act [EPA]. Importantly, the direct*

(This blaster-training module was put together, under contract, with Federal funds provided by the Office of Technology Transfer, Western Regional Office, Office of Surface Mining, U.S. Department of the Interior, located in Denver, Colorado.) Much of the information in the module is derived from the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The performance standards apply to all surface coal mines. Similar standards have been adopted on some State and local levels and applied to non-coal blasting operations such as quarrying and construction.

<sup>59</sup> [http://www.killthealbionquarry.org/flyrock\\_danger.pdf](http://www.killthealbionquarry.org/flyrock_danger.pdf).

<sup>60</sup> "Controlling the Adverse Effects of Blasting."

<sup>61</sup> "Controlling the Adverse Effects of Blasting."

<sup>62</sup> "Controlling the Adverse Effects of Blasting."

conduit resulting in this harm was the appellant's use of the environment (the air) to disperse a contaminant (fly-rock) [para. 76].<sup>63</sup> [emphasis added]

The EPA seeks to achieve its goal of protecting the natural environment and those who use it through a series of regulations, prohibitions and reporting requirements. It also provides for a wide range of inspection, enforcement, preventative and remedial powers, such as the authority to issue control orders (s. 7), stop orders (s. 8), orders requiring the repair of damage (s. 17), preventative measure orders requiring steps to ensure that a discharge does not occur or recur (s. 18), or contravention orders requiring a discharger to take compliance steps (s. 157). [para. 11]

One of the means by which the EPA promotes its protective and preventative purposes is through the prohibition in s. 14(1) against discharging a contaminant into the natural environment where it is likely to have an adverse effect, and the related requirement in s. 15(1) that any such discharge which is out of the normal course of events be reported to the Ministry of the Environment. [para. 12]

**As the interveners Canadian Environmental Law Association and Lake Ontario Waterkeeper pointed out in their joint factum, s. 15(1) is also consistent with the precautionary principle. This emerging international law principle recognizes that since there are inherent limits in being able to determine and predict environmental impacts with scientific certainty, environmental policies must anticipate and prevent environmental degradation.**<sup>64</sup> [emphasis added]

Section 15(1) gives effect to the concerns underlying the precautionary principle by ensuring that the Ministry of the Environment is notified and has the ability to respond once there has been a discharge of a contaminant out of the normal course of events, without waiting for proof that the natural environment has, in fact, been impaired [para. 20].<sup>65</sup>

Often, the factors that cause excessive airblast (concussion) and ground vibrations have the potential to cause flyrock as well. For this reason, it is crucial that blasters understand and control the factors that can create flyrock. Some of the common causes of flyrock are:<sup>66</sup>

- 1) Overloaded blastholes with excessive amounts of explosives
- 2) Heavily confined charges or the lack of relief (e.g. Lift blasts)
- 3) Explosives loaded into incompetent materials (egg. mud seams, fractures, and/or voids)
- 4) Insufficient front-row burden, causing front-face blowouts
- 5) Burdens and spacings too close together (resulting in high powder factors)
- 6) Inadequate/insufficient stemming material

<sup>65</sup> *Castonguay Blasting Ltd. v. Ontario (Environment)*, [2013] 3 SCR 323, 2013 SCC 52 (CanLII), <<http://canlii.ca/t/g1038>>, retrieved on 2019-09-27.

<sup>66</sup> "Controlling the Adverse Effects of Blasting," <https://www.osmre.gov/resources/blasting/docs/WYBlasterCertModules/8AdverseEffectsBlasting.pdf>. (This blaster-training module was put together, under contract, with Federal funds provided by the Office of Technology Transfer, Western Regional Office, Office of Surface Mining, U.S. Department of the Interior, located in Denver, Colorado.)

- 7) *Inadequate delay between holes in the same row or between rows; detonators firing out of sequence*
- 8) *Deviation of blast hole detonation from the intended sequence*
- 9) *Changing geology or rock type*
- 10) *Spacing and burden exceeds borehole depth*
- 11) *Angled boreholes*
- 12) *Secondary blasting*
- 13) *Human error, improperly loaded blasts*<sup>67</sup>

*Blasting has been, and continues to be, both an art and a science that relies heavily upon good judgement by the certified blaster in charge [p. 73].*<sup>68</sup>

*The fact is that flyrock will cause damage to the road, vehicles or even death to people or animals [p. 25].*<sup>69</sup>

The excessive throw of *rock* beyond the blast safety area is an environmental issue. Title 30 of the U.S. Code of Federal Regulations (CFR) defines 'Blast Area' as the area in which concussion (shock wave), flying material, or gases from an explosion may cause injury to persons. The CFR also states that the blast area shall be determined by considering the following:

- 1) *Geology or material to be blasted,*
- 2) *Blast pattern,*
- 3) *Burden, depth, diameter, and angle of the holes,*
- 4) *Blasting experience of the mine [personnel],*
- 5) *Delay system, powder factor, and pounds per delay,*
- 6) *Type and amount of explosive material, and*
- 7) *Type and amount of stemming.*<sup>70</sup>

The CFR definition of blast area is purely qualitative, making it difficult to rely on the definition for enforcing blast area safety regulations.<sup>71</sup>

<sup>67</sup> In the *Matter of Mario Mastro v. Hudacs*, 224 AD 2d 621 (1996) 638 N.Y.S2d 681, the appellate court upheld the findings of the Blaster Examining Board "that insufficient stemming of the blast in question and the number of holes in the area that was blasted caused a flyrock to fall on a passing motorist severely injuring him." Mastro's competency as a blaster was at issue, and the Board issued "a one year suspension of his Blaster's Certificate of Competence and the requirement that he retake the blaster's examination." ## ***Flyrock Meets Ontario EPA Definition of Contaminant***

According to the Supreme Court of Canada,<sup>72</sup> in its interpretation of Ontario's EPA, the adverse effects of "flyrock" occasioned by blasting are not trivial.

*[Castonguay] "discharged" fly-rock into the "natural environment", and there is no doubt that fly-rock meets the definition of "contaminant". The discharge was "out of the normal course of events", and it caused an "adverse effect" under the definition of that term in s.1(1), namely, it caused injury or damage to property and loss of enjoyment of the normal use of property. The adverse effects were not trivial. The force of the blast, and the rocks it produced, were so powerful they caused extensive and significant property damage, penetrating the roof of a residence and landing in the kitchen. A vehicle was also seriously damaged. The fly-rock could easily have seriously injured or killed someone.*

According to the Ontario Ministry of the Environment, Conservation and Parks (MOECC), a blasting quarry is a Class III<sup>73</sup> use. Guideline D-6 recommends a Potential Area of Impact of 1,000 metres and Minimum Separation Distance of 300 metres from the property line of a sensitive land use. A blasting quarry is the most disruptive, destructive, and polluting Class III use, and the adverse impacts of blasting can extend beyond 1,000 metres, above and below ground, especially in a karst environment.

At Miller Braeside Quarry, as acknowledged during an Ontario Municipal Board (OMB) hearing, blasting caused flyrock to travel 400 metres.<sup>74</sup> The OMB rejected *Miller Paving's* argument that the setback for the expanded quarry should be measured from the *dwelling* rather than the *property line* of the adjacent residences in a designated Settlement Area.

*[T]he general rule in key Ministry guidelines is that 300 m is the recommended minimum distance from the property line. That 300 m figure is a "minimum"; indeed, even when operations were farther from neighbours than 300 m,<sup>75</sup> adverse impacts still precipitated two Court Orders [para. 158]. [OMB Decision October 27, 2015, as amended on December 18, 2015.]*

The adjacent properties are rural residential and each has a typical lot depth of 220 metres (722 feet). *Miller*, the quarry owner, demanded the rear 150 metres (492 feet) of each residential lot be included in the 300 metre setback as part of its plan to expand the existing quarry. By demanding that the rear 150 metres of each lot be part of the 300 metre setback from the quarry, *Miller's* contribution to the 300 metre setback amounted only to 150 metres, roughly half the setback requirement. The rear 150 metres of each resident's lot, in which *Miller* has no possessory interest, would effectively be sterilized, precluding any development of the rear yard, vastly reducing the use and enjoyment of the rear yard as amenity space, and causing a significant reduction in the value of each property. (Conversely, *Miller* would benefit financially by being permitted to increase the extraction zone of the quarry by 9.7 hectares or 24.0 acres. This is akin to the taking of property rights without compensation.) Moreover, in the event that future quarry blasting causes further Flyrock incidents, the health and safety of the residents will again be endangered. A 300-

<sup>72</sup> *Castonguay Blasting Ltd. v. Ontario (Environment)*, [2013] 3 SCR 323, 2013 SCC 52 (CanLII), <<http://canlii.ca/t/g1038>>, retrieved on 2019-09-29

<sup>73</sup> MOECC D-6-3 Separation Distances <https://www.ontario.ca/page/d-6-3-separation-distances>.

<sup>74</sup> *Miller Paving Ltd.*, PL130785, OMB, October 27, 2015 <http://www.omb.gov.on.ca/e-decisions/pl130785-Oct-27-2015.pdf>.

<sup>75</sup> In 2005, one neighbour described flyrock from a "mega" blast that landed on his roof, over 400 metres from the quarry site.

metre setback or buffer zone is inadequate to avoid an adverse effect on the neighbouring residential properties, considering that past quarry blasting had propelled flyrock a distance of 400 meters into a cluster of neighbouring residential properties and caused property damage.

The OMB alluded to an earlier detailed 38-page decision of the Ontario Superior Court of Justice (Small Claims Court) issued on November 3, 2011. The neighbours claimed that “noise and odour from the portable asphalt plant interfered with the reasonable and ordinary use of their properties.” As to the severity of the harm endured by the neighbours, the trial judge had this to say:

*Overnight the enjoyment of their land and residences was substantially interfered with. The noise during the day was described as noisy especially when wind was blowing in their direction, “like a freight train,” “a fan running beside the bed,” “like being next to an airport,” “a plane idling on the runway,” “bad,” “horrible to live beside,” “louder than a diesel freightliner idling,” “place became a loud industrialized neighbourhood,” “like a big steam generator,” “slamming of tail gates,” “like sitting behind a jet engine,” “was really quiet [sic] load,” “very annoying,” “really really bad,” “a constant noise,” “unbearable,” “louder than television or dishwasher running in the house [para. 64].”*

*The odour and noise occurred on and off from September 28, 2009 to November 16, 2009...while the plant was located in the quarry. It was more frequent for some...than others depending on their times at home as opposed to times at work and sometimes depending on the wind direction. Nevertheless the noise and odour was there in the mornings, afternoons and during the night. To escape it they would close all doors and windows and stay in the house. This did not always totally alleviate the problem. The problem the plaintiffs had was that they never knew when to expect the noise or odour and they therefore could not plan any outdoor activities as they had done prior to the fall of 2009. The interference was enough to meet the severity of the harm test [para. 67].*

In his ruling, the trial judge also relied on a November 24, 2009 Air Facility Inspection Report, prepared by MOE, which states:

*[T]he operation of “this plant at this location” may be causing an adverse effect as defined under Section 14 of the Environmental Protection Act. It also stated the odour was noted as a distinct odour at 4 residences and noise levels were clearly audible at 16 observations [para. 77].*

Miller’s “air quality” experts’ evidence was characterized by the judge as less than credible:

*I find it impossible to accept the findings of Mr. Trought and Dr. Wiseman that plaintiffs['] symptoms are caused by vehicle exhaust, wood burning, cigarette smoke or food as opposed to the fumes from the plant [para. 81].*

Residential land uses, including associated amenity space, are considered *sensitive* 24 hours per day (D-6, p.3). Finding in favour of the neighbours on the torts of *trespass* (in the form of contaminants), *negligence* (duty of care), and *nuisance*, the court alluded to “the character of the neighbourhood,” and found that it had significant “residential” traits:

*[The area] is zoned rural and if anything it would be much more residential than commercial, as there is only a roof truss business, a quarry and farming property in the area as opposed to approximately 150 residential houses....*

*The plaintiffs were aware that there was a quarry when they purchased their properties but they did not know that this asphalt plant was going to operate in it...The noise and odour that they*

*experienced when the plant started was severe. Overnight, the enjoyment of their land and residences was substantially interfered with....*

On appeal,<sup>76</sup> the *trespass* and *negligence* convictions were overturned. The *nuisance* claim as well as the *damages* were sustained, with the appeals court, again, recognizing the “character of the neighbourhood” as being more residential:

*The trial judge determined that the quarry was in a rural area that had a mix of uses but which was primarily residential in character....In the present appeal, there is adequate evidence to support the trial judge's finding that the area was, in his words, "much more residential than commercial."*

*Miller Paving Ltd.*<sup>77</sup> was denied leave to appeal the OMB's October 27, 2015 decision, as no “question of law” was raised. In upholding the OMB decision imposing a 300 metre setback from the *property line* of nearby residences, the Superior Court of Justice (Divisional Court), stated, in pertinent part,

*Section 4.1.1 [PPS] is for potential influence areas within which adverse effects may be experienced for industrial uses setting the distance for Class III at 1000 m. Section 4.3 recommended minimum separation distances for Class III at 300 m [para. 24].*

*Miller has put forth the position based on the facts of the case and the decision of the OMB. In reviewing the decision, I do not agree that there is a question of law. The OMB was cognizant of the provincial interest as well as the expert opinions and the arguments of the property owners. The Province provided no evidence at the hearing. The Provincial Guidelines were just that guidelines. **The OMB considered the evidence and concluded as set out in the Official Plan, namely section 11(2) (3) concerning limiting the disturbance to the subject site. [emphasis added]** Miller has not provided any authority to support its argument that there is a question of law. The decision of the OMB was one based on the evidence provided at the hearing and at best, is a question of mixed law and fact [para. 32].*

*There is nothing that has been presented by Miller that puts into substantial doubt the decision of the OMB on this issue. On reviewing the decision, there is ample evidence that the OMB used to support its decision. The OMB did not solely rely on the Guideline D-6. **There is nothing directed to this Court that the using of Guideline D-6 would bring the correctness of the OMB decision into serious doubt [para. 39]. [emphasis added]***

Again, in 2017, *Miller*<sup>78</sup> was found liable for damages in *nuisance* for interference caused to the enjoyment and use of each plaintiff's property, located nearby in a designated Settlement Area. The court heard from 21 witnesses over the course of a twelve-day trial before issuing its ruling in favour of the residents. The interference caused by the operation of the asphalt plant arose from “*odour, noise and dust*” that significantly impacted all fourteen residents' ability to enjoy the “full” use of their properties. The court found that the interference was “substantial,” meaning it was “non-trivial.” Each resident testified that they would not have chosen to reside proximate to the quarry had they known how the operations of the temporary asphalt plant would affect them.

<sup>76</sup> *Moore v. Smith Construction Company, a division of the Miller Group Inc.*, [2013] O.J. No. 3768, <<http://canlii.ca/t/g04d5>>, retrieved on 2019-10-01. In *Lambrecht v. County of Will*, 217 Ill. App. 3d 591 (Ill. App. Ct. 1991), 577 N.E.2d 789, the appeals court upheld the trial court's ruling to deny a quarry permit, which, in part, “found the existing uses of nearby property to be residential and farmland, with the land located north of the [subject] property being predominantly residential.”

<sup>77</sup> *Miller Paving Limited v. The Corporation of the Township of McNab/Braeside et al*, 2016 ONSC 6570.

<sup>78</sup> *Battiston v Smiths Construction Company*, 2017 CanLII 77336 (ON SCSM), <<http://canlii.ca/t/hnsh8>>, retrieved on 2019-10-07.

*I base my conclusion that the interference was “substantial” based upon how the effects of the plant’s operation impacted the plaintiffs. While the defendant produced records to support the fact that the noise / odour issues were not constant and that their complaints as chronicled in a diary would suggest occasions when odours or noise were not experienced daily, the bottom line is that it impacted the plaintiffs’ ability to regularly enjoy their properties. They were no longer willing to continue with their gardens and outdoor activities due to concern of possible negative health effects and the unpleasantness of being outside when the odours and/or noise were present. The plaintiffs spoke of no longer planning social events (barbecues) because it was impossible to predict whether the plant would be operating. This hindered or ended planned activities. **In every instance, the plaintiffs testified, had they known the negative impact the operation of the temporary asphalt plant would have on them, that they would not have chosen to purchase their home** [para. 19]. [emphasis added]*

As to whether the interference was reasonable, the court rejected *Miller’s* defense of compliance with regulatory noise and odour emissions limits, finding that compliance with statutory limits does not make the interference complained of reasonable, commenting, in pertinent part, as follows:

*Various factors such as the severity of the interference, the character of the neighbourhood, the sensitivity of the plaintiffs, the frequency and duration of the interference, and the utility of the conduct may be considered in making this determination, depending on the particular circumstances of the case. There is no finite list. **The focus, generally but not absolutely, is on whether the interference suffered by the plaintiffs is unreasonable, and not on whether the nature of defendant’s conduct is unreasonable.** [para. 22] [emphasis added]*

*[T]he defendant relied upon the third party investigations by both the Ministry of Natural Resources and the Ministry of Environment, which, for the most part, confirmed that there were emissions but which found that the noise and odour emissions from the plant were within acceptable statutorily mandated limits [para. 31].*

All fourteen residential neighbours were awarded damages. While recognizing that providing asphalt under a government contract has public utility, the court noted that *Miller* is a “for profit” operation. No evidence was presented to suggest that alternative locations for the portable asphalt plant were not feasible, even if less convenient. (para. 28) As observed by the court in the prior 2009 decision,

***A private, for-profit company should be required to pay the full cost of its operations without forcing the plaintiffs to effectively subsidize its business through the free use of their properties** [para. 28]. [emphasis added]*

Although the OMB approved expansion of the Miller Braeside quarry to within 300 metres of the neighbouring residential properties, there is some doubt as to the reliability of the “air quality” study prepared on behalf of *Miller* that supported the expansion.<sup>79</sup> An independent air quality assessment for the proposed Miller Braeside quarry expansion, unrelated to the parties involved in the dispute over the quarry expansion, appeared in the 2015 issue of *Air Qual Atmos Health*,<sup>80</sup> and recommended against the quarry expansion.

<sup>79</sup> The 2008 *Operations Manual for Air Quality Monitoring in Ontario* remained in effect until June 30, 2018, with the revised manual taking effect July 1, 2018. The Manual is based on the procedures used by national agencies such as Environment and Climate Change Canada (ECCC) and the United States Environmental Protection Agency (US EPA). <https://www.ontario.ca/document/operations-manual-air-quality-monitoring-ontario-0>.

<sup>80</sup> Sabah A. Abdul-Wahab, Hedia Fgaier, Ali Elkamel and Keziah Chan, “Air quality assessment for the proposed Miller Braeside expansion in Canada: TSP,” *Air Qual Atmos Health* (2015) 8: 573-589.

The study sampled potential impacts of total suspended particulates (TSP) or particulate matter (PM<sub>10</sub>). Typical emission sources include dust generated from excavations, quarry, drilling, grinding, gathering, conveyance, and truck loading.

*The corporation most highly affected by emissions from the proposed expansion or even the present quarry site is the Arnprior Golf Club, which is located only 2.3 km to the east of the quarry, and the Arnprior Golf Club at Sand Point, which is located within 2 km north of the quarry. The closest residential area to the Miller Braeside quarry is the village of Braeside, which is located within 3 km southeast of the quarry site. Braeside is a dissolved municipality with 191 residents living in an area of 1.86 km<sup>2</sup> (Statistics Canada 2013b). Located further southeast, within 8 km of the quarry site, is the town of Arnprior, which contains the closest hospital to the township of McNab/Braeside, the Arnprior and District Memorial Hospital which is situated 7.3 km away. With only a total land area of 13.04 km<sup>2</sup>, the town of Arnprior was recorded to contain a population of 8114 residents in 2011, which is greater than the entire population recorded for the township (Statistics Canada 2013a). In addition, nearby the quarry site in the southwest direction lies the city hall of the township of McNab/Braeside, situated 5.5 km away, and the McNab Public School, situated 6.8 km away. Across the Ottawa River, within 6 km north of the quarry site also lies the settlement of Norway Bay, which is part of the municipality of Bristol in Quebec, Canada [p. 575].*

TSP concentrations were simulated on various days throughout the year to address seasonal variations in 2003 and 2013. The TSP samplings generated the following findings:

*[T]he spring day of April 15, 2003 was determined to have the highest 1-h average TSP concentration, while the summer day of July 11, 2003 was determined to have the highest 24-h average TSP concentration out of all 4 days analyzed. In the year 2003, the highest 30-min average TSP concentrations on January 12, April 15, July 11, and November 17 were determined to, respectively, be 1135.15, 1782.32, 1017.74, and 1393.65 µg/m<sup>3</sup>. These TSP concentrations all significantly exceed Ontario's MOE 30-min criterion of 100 µg/m<sup>3</sup>. Likewise, in the year 2013, the highest 24-h average TSP concentrations on January 12, April 15, July 11, and November 17 were determined to, respectively, be 132.86, 82.01, 146.07, and 104.9 µg/m<sup>3</sup>. The TSP concentrations on January 12, July 11, and November 17 are all well above Ontario's MOE 24-h criterion of 120 µg/m<sup>3</sup>, while the concentration on April 15 is well under this limit [p. 587-588].*

*Taking these 4 days as a representation of each season, it can be concluded that overall the predicted maximum TSP levels are not within the limits of the applicable standards. In addition, it should be noted that with the changing seasonal weather, TSP concentrations may even exceed the concentrations determined in this study and disperse further from the quarry [p. 588].*

***During the hours or days where TSP concentrations are high, citizens residing, working, or touring nearby the [Miller Braeside] quarry would experience serious adverse TSP effects. In particular, children, the elderly, and citizens allergic to TSP experience the most hazardous effects of TSP. Unfortunately, many residential areas, in addition to both a hospital and school, are found to be located within close proximity to the quarry [p. 588].***[emphasis added]

Short of a number of suggestions, the study nevertheless concluded that,

*[I]n its current proposed state, it is not recommended that the proposal for the expansion of the Miller Braeside Quarry be approved as a result of health and safety issues [p. 588].*

## ***Reliability of Testing Fugitive Dust from Quarrying***

Despite the public's growing need to know what toxic pollutants were being emitted by industrial operations into the soil, water and air, surface mines and quarries were exempt from preparing an emissions inventory for *Canada's National Pollutant Release Inventory* (NPRI).<sup>81</sup> Why surface mining and quarrying operations were exempted from the reporting requirements is unclear,

*but it was likely a combination of industry lobbying, and substantive issues including the difficulty of characterizing certain emissions sources at mines. But with the addition of the seven Criteria Air Contaminants (CACs) - including particulate matter (PM) - to the list of reportable substances in 2001, this exemption was reconsidered (Environment Canada, 2006) [p. 1].*<sup>82</sup>

Quarries generate large quantities of *particulate matter* (PM), and allowing the quarrying industry to remain exempt from the reporting requirements was found to be unacceptable. In 2007, quarrying was added to the list of industries required to report on their emissions.

*Particulate matter (PM) is the dominant airborne pollutant from surface mines and a substance notorious for its health consequences (In yang and Bae, 2006, Kon, et al., 2007). The true danger of PM is that substances stakeholders believe to be harmless --- like the limestone extracted from quarries --- can cause injury and death to humans, wildlife, and plants when in particulate form (Salvi and Holgate, 1999).*

It has been suggested that policy-driven data collection such as an emissions inventory is typically a perfunctory exercise fulfilling procedural requirements rather than scientifically validating quantification of the emissions values (Swart et al. 2007). According to *Weinstock*, scientific validity means applying an approach that will lead to accurate emissions reporting, which is something that the current NPRI pits and quarries guidance does not stress. PM emissions calculations are based on equations (AP-42) developed by the United States Environmental Protection Agency (USEPA), which are based on meteorological data and material properties of questionable quality:<sup>83</sup>

*The quality of these equations is questionable [p. 3-6], and USEPA admits (USEPA, 1995) that their completeness and detail is limited by the published references used to develop them. Even still, the USEPA and Environment Canada consider them to be appropriate for inventories and permit applications across a range of industries...[including] surface mines...*

According to the Western Regional Air Partnership (WRAP), *dust* is defined as “particulate matter of a *geologic, organic* or *synthetic* origin that is, or has the potential to be, suspended in the atmosphere as a result of mechanical abrasion, wind erosion, or explosive activities [i.e., blasting].”

*Weinstock* measured emissions from *unpaved roads, material handling* and *storage piles* at three limestone quarries in Quebec using the AP-42 emissions factor method, while

<sup>81</sup> “Pits and quarries reporting guide,” <https://www.canada.ca/en/environment-climate-change/services/national-pollutant-release-inventory/report/pits-quarries-guide.html>.

<sup>82</sup> Aaron B. Weinstock, “Quantifying Dust Emissions From Limestone Quarries: Data Selection and Uncertainty Assessment,” Thesis, 2009. <https://digital.library.ryerson.ca/islandora/object/RULA%3A1692>.

<sup>83</sup> “Fugitive Dust from Mining and Quarrying,” <https://www.epa.gov/sites/production/files/2015-08/documents/minqur3.pdf>.

addressing the error of using 30-year climate averages, the uncertainty introduced by typical material properties and the limited availability of climate data.

*When temporal resolution was increased by calculating emissions using a combination of daily and hourly climate data instead of the 30-year averages advocated by the NPRI, the differences in emissions calculated using the established procedure were not consistently higher or lower, but were source- and weather station-dependent. Compared to the 30-year climate average method, the use of daily/hourly climate data resulted in emissions from unpaved roads between 38.95% and 42.50% higher; emissions from materials handling that were between 15.31% lower and 18.64% higher, and emissions from wind erosion of storage piles were all lower by 12.48% to 37.50% [p. 110].*

Haulage truck traffic on unpaved roads represents about 50% of a quarry's total particulate emissions (Ghose, 2007), which based on Weinstock's calculations is significantly understated. In comparison, about 34% of all particulate matter in the atmosphere originates from traffic on unpaved roads (p. 22).

*Unpaved roads are typically graded and compacted road beds or composed mainly of the underlying parent material (William et al, 2008). Dust is generated by the pulverization action of the wheels on road surface materials, with the dust discharge increasingly linearly in proportion to the amount of traffic (Western Regional Air Partnership, 2006). Williams et al. (2008) add that some uplift is also attributable to movement in the vehicle's wake [p. 23].*

*In addition to a positive correlation with the amount of traffic, Watson et al. (2000) cite two studies suggesting that dust emissions are negatively correlated with silt content of the road surface. This is in direct conflict with the formula adopted by the NPRI for calculating emissions from unpaved roads, as it positively correlates emissions with the siltiness of the road. These two studies suggest that roads with higher gravel content will have greater abrasive action and therefore have higher emissions (Watson et al., 2000) [p. 23].*

## ***HOLDING ENVIRONMENTAL CONSULTANTS ACCOUNTABLE***

Results of an investigation that appeared in the June 21, 2019 issue of Canada's National Observer<sup>84</sup> describe how Canada used dubious research to approve major industrial projects. Consultants conducting environmental assessments were often pressured by their own company or clients to downplay environmental concerns, and avoid use of the word "significant."

***In the world of environmental assessments, few words carry as much significance as "significant."***<sup>85</sup> [emphasis added]

*Simon Halfyard\* knows that better than most. A biologist who works as an environmental consultant in British Columbia, he works for a company that was hired by a sub-consulting firm to do an assessment of the risks and impacts associated with a large-scale natural gas project on the province's north coast, which was going to consume hectares of land. (He asked that his real name not be used for fear of reprisal.)*

*It became clear to him that a large amount of critical fish habitat was going to be lost to the footprint of the project.*

*"So in my interpretation of this, I declared this particular project to be a 'significant' risk," he says. "You want to try and avoid significant effects."*

*His assessment wasn't well-received by his manager, who made it clear he was going to have to tone down his language and focus on the minimum requirements — to strive, Halfyard says, "for mediocrity."*

*"You can't say significant," Halfyard recalls being told by his manager. "You're putting the project at risk."*

*The pressure persisted — from his own company, as well as the company that had sub-contracted them. Statements were removed from his report, and he was called out by the project manager as uncooperative in abrasive emails to his employer.*

*"I had two levels of censorship," he says. "I didn't understand why I should be unfairly pressured to undermine my professional judgment."*

*Halfyard is one of several scientists who spoke to National Observer about their experiences with environmental assessments on major industrial projects that got approved after their proponents submitted dubious evidence in their applications. The consultants all experienced similar pressure to overlook evidence that might make it difficult for projects to get approved by regulatory agencies....*

---

<sup>84</sup>. Holly Lake, "Insiders reveal how Canada used dubious research to approve major industrial projects," <https://www.nationalobserver.com/2019/06/21/investigations/insiders-reveal-how-canada-used-dubious-research-approve-major-industrial>. The investigation is part of a special National Observer report about oversight of regulated industries, in collaboration with the [Corporate Mapping Project](#) — a research and public engagement initiative, jointly led by the University of Victoria, Canadian Centre for Policy Alternatives and the Parkland Institute, and supported by the Social Science and Humanities Research Council of Canada.

<sup>85</sup> Section 4(b) of *CEAA 2012* with respect to the "Precautionary Principle" requires that assessments of proposed projects "...are considered in a careful and precautionary manner to avoid significant adverse environmental effects." [emphasis added] Section 19(1)(d) of the *CEAA 2012* indicates that the environmental assessment must take into account "mitigation measures that are technically and economically feasible and that would mitigate any significant adverse environmental effects of the designated project" (emphasis added).[para. 107] In *Taseko Mines Limited v. Canada (Environment)*, 2017 FC 1099 (CanLII), the Federal Court upheld the Review Panel's decision in which it did not agree that Taseko's proposed mitigation measures were feasible or that they could mitigate the significant adverse effects of the project *with respect to water seepage and impact on water quality in Fish Lake (Teztan Biny) and the surrounding area* [para. 1]. <<http://canlii.ca/t/hp4hn>>, retrieved on 2019-12-31.

*In the middle of his own experience, Halfyard's manager told him he was a "brilliant biologist" during a performance review.*

*He responded by asking why then was he being told to break the law by not reflecting his findings in his assessment. He's a member of British Columbia's [College of Applied Biology](#) — the first of its kind in North America. It was created by the provincial legislature in 2002 to regulate the professional conduct and competency of its members.*

*"My ethics are legislated under provincial law," Halfyard says. "Our requirement is to uphold the interests of the public and the goals of environmental stewardship."*

*Just over a week after putting the question of breaking the law on the table, he says he was called into the same office again and fired.*

*"I was challenged and ultimately lost my job because I was not cooperative. I was a liability for upholding my professional accountability."*

*The project was not given the declaration of "significance" in the assessment. Halfyard doesn't understand the resistance he faced, given that projects with that declaration can still go ahead.*

### **Pressure to do things or say things that I didn't think were true**

*While Halfyard was operating under the provincial environmental assessment regime in British Columbia, Tom Manning\* says the experience is no different under the federal regime.*

*A fisheries biologist who specializes in fish habitat, he started doing environmental assessments in the mid-1990s, but no longer does them in Canada.*

*He no longer does assessments for project proponents as he "felt that pressure to do things or say things that I didn't think were true based on the science that I knew."*

*His biggest issue with how things are handled in this country is that proponents hire environmental consulting firms, whose scientists assess a project's impact as part of the process of getting the green light from regulators to move ahead.*

*"There's an inherent conflict of interest there because the people paying the bills expect you to be able to permit a project. There are times when the science will tell you this is not a good project and it's going to be damaging to the environment, to wildlife, fish or birds. And there (will) be pressure on you to go ahead and (recommend something that would allow regulators to) permit it anyway because the proponent, the developer, is paying you to do that," Manning says.*

*In the United States, when a proponent applies for a project permit, the environmental impact assessment is done by a third party hired by the Environmental Protection Agency, so there is more independence from the project proponent.*

*"That's the way it's done everywhere else in the world," he says. "(In Canada), there isn't that independence."*

*That means junior scientists who discover risks are told not to include damaging findings in their reports. Sometimes the project is simply taken from them. More senior scientists will probably be permitted to write what they've found in their report, but it just won't be released, says Manning, who says he's had horrified looks from his bosses, insisting, 'You can't say that!'*

*"Then I'm like, 'Well, that's what the analysis shows, so that's what's going in my report,'" he says.*

*"They'll pay your consulting fee, take your report and it'll just get thrown in a bin somewhere and you won't get a job with them again. If you speak up too much against the project, you'll probably just get fired."*

*These days, Manning works independently and only does environmental assessments for NGOs, governments or community groups.*

*"I don't generally do them for developers because they use too much bias and pressure when I come up with a certain answer."*

### **Recommendations for independence**

*In August 2016, ahead of introducing Bill C-69, McKenna established an expert panel to review federal environmental assessment processes.*

*Among its recommendations was taking the hiring of consultants who conduct assessments away from proponents and instead have the government create an independent agency that would select them.*

*“That was rejected by the government,” says Martin Olszynski, an associate law professor at the University of Calgary.*

*“So there is nothing in the act that addresses it directly.”*

*Justina Ray, president and senior scientist at the Wildlife Conservation Society Canada, isn’t convinced the third-party route solves the problem, as governments will often hire the same consultants and sink into the same traps. While the process might be different, much depends on culture and the capacity to steward things properly, she says.*

*“Agencies can also get captured by industry. I’ve seen it time and again.”*

*For her, the key is a robust review process that holds proponents and consultants accountable for assessments and enhances transparency.*

*“If your work undergoes a rigorous review, you’re going to aspire to do a better job next time. I think many of these processes get away with relatively weak reviews, so that permits them to follow a formula, if you will, on these assessments, where they don’t get challenged sufficiently.”*

*Earlier this year, a study by Adam Ford, a professor of biology at the University of British Columbia, found that companies in the oilsands were [using inconsistent scientific methods](#) in their own assessments, and rarely subjecting their work to independent verification.*

*Ford, who grew up in Calgary, looked at 30 different oilsands assessments conducted between 2004 and 2017 as part of his research.*

*In an interview, he told National Observer that his research found that companies were using different ways to measure wildlife habitat in their assessments. The research also found that the oilsands companies who actually got their work reviewed independently had less confidence about being able to mitigate damage caused by their projects.*

*“It would be far more efficient as a whole if they co-ordinated on how to do the science,” he said. “That would make everybody’s job so much easier. It would be much easier to review the projects.”*

*Instead, he said that companies are all using different models, which he said makes no sense from either a scientific or economic standpoint.*

*“It’s inefficient for the industry and I think it makes for questionable assessment.”*

### **Looking for birds when they're not around**

*In 2008, Matt Farrell\*, a wildlife ecologist, was hired to do an environmental assessment for a company in the Alberta oilsands that was looking to expand an extraction site.*

*The focus was on a threatened species of birds in the boreal forest, and the prime window for finding them ranged from the middle of May to the middle of July. It was up to the proponent who’d hired him to decide when the surveys occurred, and he was brought in to do the first one on July 8.*

*“When you go out to do wildlife surveys, you’re interested in knowing whether the wildlife is there or not. And it just seemed to me like maybe they didn’t want to know,” he says.*

*“We didn’t detect any on the surveys we did, but I would be very hesitant to say that there are no birds there of that species because I don’t think that we surveyed for them properly.”*

*Of his first survey on July 8, Farrell says: “If you wanted to actually survey for it properly you’d have to be surveying before then.”*

*But even if the birds were there, he and his team wouldn't have detected them because the birds were unlikely to be singing or responding to the playbacks they were using that far into the breeding season.*

*"I don't know if that was intentional or not, or if it was sort of a rush thing where they just needed somebody to be out there as soon as possible. On paper, everything that (the proponent) did was legitimate and sort of met the rules that are required. But in my mind, it was sort of the minimum required. It could've been done a lot better."*

*In his report, Farrell recommended surveying again the following year from the mid-May to mid-July.*

*"I don't remember hearing back from them about the recommendations in this one," he says.*

### **The science in Canadian assessments 'sucks'**

*Generally speaking, Olszynski says, the science in Canadian environmental assessments "sucks."*

*When Bill C-69 was before the House Standing Committee on Environment and Sustainable Development, an amendment by Green Party Leader Elizabeth May was adopted to add a duty for all actors on the government side — scientists, panels and agencies — to act in a manner that "adheres to the principles of scientific integrity, honesty, objectivity, thoroughness and accuracy."*

*"It really should have applied to proponent scientists as well," says Olszynski, who appeared before the expert panel, commented on its terms of reference and was commissioned by it to write policy briefs. He also appeared before the House and Senate committees studying the bill.*

*"But I think it's still an improvement."*

*As for the current state of things, he's clear that he doesn't think consultants are bad people.*

*"I think they're in a dynamic here that's very difficult to undo. My hope is that by recognizing that their work will be subject to scrutiny by people who are subject to that kind of duty, it will exert a downward pressure on proponents. And consultants will have something to push back with against proponents."*

*The language in May's amendment is borrowed from the United States, where the duty of scientific integrity has existed as part of the process for 30 years. But in Canada, Olszynski notes, the courts have taken a laid-back approach to assessments, not wanting to wade into the science, and instead deferring to government reports that are built on proponent reports.*

*"All of that has created a perception in the consulting community — or at least among the lawyers working for proponents, who are then leaning heavily on those consultants — that they don't need to do much work here. It doesn't have to be robust or rigorous because no one is going to touch it with a 10-foot pole."*

*Olszynski compares the situation to one in which lawyers for a company that is being audited advise the auditors about what's appropriate.*

*"That just doesn't work, yet we have this reality where we know proponent lawyers are advising consultants. That's not addressed by (Bill C-69)."*

*While there was a push during consultations and hearings to force more data-sharing and install a more rigorous approach to data review, it didn't get translated into the bill — despite a recommendation from the expert panel.*

*"We've been told there will be a policy essentially of open data, but time will tell," Olszynski says.*

*While the existing Canadian Environmental Assessment Registry allows access to some information, including proponents' environmental impact statements, the underlying data is missing most of the time.*

*"It makes it hard to scrutinize the conclusions if you don't have the underlying data," Olszynski says.*

*So, he wonders, why not open this up to what's called sunshine enforcement?*

*“The reality is that it’s hard for the regulator. They can’t scrutinize everything the proponents submit to them, but if you put it on a public registry that’s easily accessible, and enlist the public and academics and researchers in your efforts, we are then diving into that data because we want that for our own purposes. So we can then identify issues with compliance or non-conformity.”*

*The levels of rigour and transparency are no different after the assessment phase. There are always terms and conditions under the Environmental Assessment Act that require monitoring reports and follow-up reports, which Olszynski says are very hard to get your hands on.*

*“As it currently stands, you very often have to file an ATIP (Access to Information and Privacy request) to get that information. That just isn’t the way it’s supposed to be. A lot of people feel strongly it should be made public.”*

*He’s done his own research showing that while proponents commit to adaptive management during the assessment process, they never follow through and actually do it.*

*“That’s why we’re left with tailings ponds and this idea that we really don’t know how to remediate them.”*

*And in some cases, mitigation commitments are made with no data to back up their effectiveness.*

### **Industry will figure it out**

*Petr Komers, who has been running his own Calgary-based environmental consulting company for nearly 20 years, says the scientific community is somewhat hopeful that the science and the rigour of the review process will improve under C-69 — but the scientists are not holding their breath.*

*“It’s nice to talk about scientific integrity, but at the end of the day if it’s all you do, that can be in the eye of the beholder,” he says. “We need stronger language, something more concrete. What statistics? What analysis? Over what period of time? What geographic area? I’ve been battling with regulators for decades now saying you need to be more descriptive, but they rebut it.”*

*Komers, also a co-author on the recent study of oilsands project assessments that was led by Ford, recounts a conversation he had with a former director of the Alberta Energy Regulator (AER), who was adamant they didn’t want — or need — to be prescriptive.*

*“We believe the industry and engineers will figure it out,” Komers recalls him saying.*

*“That’s the reality on the ground.”*

*Just a year ago, he testified at a hearing before the AER on behalf of the Fort McKay First Nation. The community was opposed to a pilot project by Prosper Petroleum Ltd. in the Moose Lake Management Area and the impact it might have on vegetation, water and wildlife — specifically caribou and moose.*

*It was considered a pilot project because it would pump out less than 12,000 barrels of oil a day, which meant it only required the lowest level of impact assessment, known as a screening.*

*“I’m even coy in saying that, as it implies a proper study,” Komers says, noting a screening can be done from a computer at a desk.*

*Appearing before the AER on behalf of the First Nations community, Komers pressed the proponent about its assessment report and whether any wildlife surveys had been done as part of it. The proponent said they hadn’t done any and were relying on data gleaned from existing literature and other surveys.*

*In contrast, as part of their population viability analysis of moose and caribou in the area, Komers and his team had used vegetation data, mostly based on remote sensing, to quantify the availability of habitat, and old satellite images of the area to show how it’s changed over the past two decades.*

*“We can exactly calculate how the vegetation on the land is changing. We have data we gathered ourselves,” he says. “There is a negative trajectory of habitat for moose and caribou and other old growth species — it’s declining, there’s no two ways about it.”*

*Komers says the Fort McKay First Nation is “quite business-savvy and not against the oilsands, per se.” In fact the community has existing agreements with industry. But residents were already seeing*

*the impact of development on the conservation area — and they wanted to reverse those effects, not add to them, to ensure they still had a safe place for their traditional land use.*

*“Here, they drew a line in the sand,” he says, noting it was clear the impact on the area wasn’t going to be reversed by adding another project to the mix.*

*The proponent said it had a mitigation plan in place that would reverse the project’s impact, something Komers pressed them on, as no one on the proponent side had gone into the field, nor did they present any scientific, peer-reviewed literature to support their claims.*

*“They just don’t have the data that would tell you whether, or to what degree, a certain mitigation measure is successful,” he says. “And yet, in the hearings and in their submission, they claimed that their project will not have any such effects.*

*“The regulators accepted their claims, saying that, ‘Yeah, the proponent has mitigations in place and so the environment will be sufficiently protected.’ Our whole point was there is no data supporting those claims. They dismissed our evidence in favour of accepting the unsubstantiated, undocumented claims by the proponent.”*

*What’s more, the proponent tried to show Komers’ findings overstated the project’s impact.*

*“It was very odd,” he says. “The decision by the AER rebutted all of our calculations of vegetation disturbance and wildlife population declines. If we’re wrong, we’re wrong. That’s the scientific process: if they have better analysis and data and show we did our calculations wrong. But they simply stated that we overestimated the effects and the proponent has limitation measures in place.*

*“It was very blatantly a biased assessment that the panel decided to disregard our numerical, data-driven evidence, but accepted the verbal claims without any scientific underpinning.”*

*The Fort McKay First Nation has appealed the decision, and it’s now before the courts.*

*Komers says this is a case where “even with the Canadian Environmental Assessment Act changing, it wouldn’t have an effect.”*

*Under current law, proponents are required to measure the effectiveness of mitigation and bring data to demonstrate that their efforts have worked.*

*“To this day, that’s extremely rare,” he says. “You can’t measure anywhere in the oilsands where this condition on an approval has been complied with — not for wildlife or vegetation ecology.”*

*Once a forest and land cover has been disturbed, especially if that includes the soil, Komers says it’s very hard to return it to how it was before. While a proponent can put in some soil and plants, the best that can be accomplished is the creation of what’s known as a novel ecosystem.*

*“I can confidently say that in terrestrial ecology we are not aware of any example, despite us asking, were you can say a pre-disturbance condition has been achieved.”*

*He says that in areas where there were once 150 to 200 species of vegetation, after reclamation there are maybe 15 or 20.*

*“You have about 10 per cent of the diversity,” Komers says. “To a layperson in the oilsands, you can see a reclaimed forest and think it looks OK. To an ecologist, it looks poor.”*

*He recalls one time walking through a reclaimed forest with a group of elders. They repeatedly commented on how quiet it was, as there were no birds.*

*“You hope the wildlife comes back, but what you end up with is an ecosystem composed of different species, usually fewer species. They’re usually more tolerant of human activity — white-tailed deer, coyotes, magpies — as opposed to the wolves and cougars, which are old-growth species.”*

### **Failure to address transparency, cumulative impacts**

*If passed, the new federal environmental-assessment regime will stay in line with the changes made by the Conservative government in 2012 and only apply to major projects, leaving thousands of other proposed projects in Canada to fall under provincial regimes. Olszynski says the recent project list put out by the federal government is the same as the current one — and in some cases*

*actually weaker in the sense that it raises the threshold. For instance, it will capture fewer mining projects than the current regime does.*

*That's not great news from a transparency perspective, as some provincial acts, including in Ontario, don't require that the identity of those reviewing assessments be disclosed.*

*"It doesn't make those reviews transparent to the public or interested parties, but (proponents) will respond to the reviewers. That often leaves them in a cherry-picking situation whereby they are taking only certain points and addressing them in their responses, even though the reviewers had been much more detailed and perhaps critical," says Ray of Wildlife Conservation Society Canada.*

*Currently, she says, it's difficult to see what concerns were raised in the course of a review or how they were addressed, if at all. Even when she knows there have been a large number of letters submitted to the regulator outlining significant concerns and issues, "none of those see the light of day."*

*"That really has to improve, and I don't know how this regime will improve that because it's a lot about capacity and culture of the agency," Ray says.*

*"The agency needs to be able to disclose the reasons for its decision. That has happened to a limited extent in Bill C-69."*

*For her, the biggest hole in the legislation is its failure to address the cumulative effects of projects. In her view, the focus of assessments is still far too narrow and doesn't look at the big picture beyond the effects of the project at hand, to account for past and future ones. Effects can be additive, with the impacts of multiple projects on top of one another, or the project itself may contribute to or aggravate cumulative effects. That can happen by inducing growth by bringing in a road that allows other projects to come into the same area.*

*"When a project starts, it's already starting with a legacy of impact. It has to take that into account into its baseline conditions much better than it does right now," Ray says.*

*Komers says the cumulative effects of projects in Alberta, where countless projects undergo screenings rather than a full environmental impact assessment, is "huge," and well-documented in peer-reviewed literature and government reports.*

*"The caribou have been declared as non-sustainable in Alberta (as a result of habitat loss), and that's Environment Canada saying that, not me."*

*Provisions calling for a broader regional approach have been part of the law since the 1990s, but it's usually individual project assessments that get burdened with gauging the broader implications, so they've been only dealt with in a limited fashion to date. Bill C-69 isn't going to improve that.*

*While the legislation mentions and enables regional assessments, which are the only place cumulative effects can be seriously studied, Ray says even those provisions are "weak."*

*"There are no instructions or anything about the conditions where they really should be triggered. You could and should develop those in regulations, but that hasn't occurred yet," she says. "Many of us are disappointed. You can imagine a scenario where it might never happen unless there's some key triggers."*

*Her concern is compounded by the fact that plenty of projects in Ontario won't ever trigger the federal framework, leaving them to be assessed under the provincial act, which doesn't even mention cumulative effects or regional assessments.*

*By not looking at the bigger picture, "We're missing the forest for the trees," Ray says.*

*\* Names have been changed to protect the identity of sources*

Consultants can be held accountable to third-parties for acts of negligence in the performance of their professional duties and obligations. As to the level of competence and due diligence required of a consultant, it will depend on the nature of the alleged *tort* and often engage the standards of profession practice and duty of care associated with the

particular profession. A third-party that has sustained injury to property or health from operation of a quarry, established (permitted) on the recommendations or findings of applicant-retained consultants, could launch an action if there is sufficient evidence to support a causal connection between the alleged injury and the applicant-retained consultant (e.g. negligent misrepresentation, a failure to address, warn or inform others of potential damage to property or harm to persons as a consequence of blasting, dewatering, equipment usage, etc.). It must also be proven that the applicant-retained consultant owes a legal duty to the third party. Before considering pursuing an action against an applicant-retained consultant, legal advice should be sought. A number of third-party claims against environmental consultants have been filed, examples of which are as follows:<sup>86</sup>

- A consultant was sued by an assignee of its contract for failing to identify hazardous waste contamination in an assessment report.<sup>87</sup>
- After its business collapsed, a neighbor to GE's contaminated property sued GE's consultant for negligently performing a site investigation.<sup>88</sup>
- A group of individuals "residing near" the Rocky Mountain Arsenal sued the government and Shell Oil Company for "personal injury and property damage as a result of airborne pollutants released during the joint cleanup effort at the Arsenal by Shell and the Government."<sup>89</sup>
- A consultant whose contract was with Washington Metropolitan Area Transit Authority was sued by a heavy equipment operator who contracted silicosis while mucking in a tunnel under construction as part of the subway system.<sup>90</sup>
- A consultant for a cantaloupe grower who conducted a food safety audit at a cantaloupe packing facility (but who was not retained to test cantaloupes) was sued after a listeria outbreak killed 33 people and made 147 people sick.<sup>91</sup>

---

<sup>86</sup> Joel Schneider, *The Expanding Liability of Environmental Consultants to Third Parties*, 13 Vill. Envtl. L.J. 235 (2002). Available at: <https://digitalcommons.law.villanova.edu/elj/vol13/iss2/2>.

<sup>87</sup> *Bronstein v. GZA Geoenvironmental, Inc.*, 665 A.2d 369 (N.H. 1995) (finding no tort liability because consultant owed no duty of care to ultimate purchasers of property).

<sup>88</sup> *Midwest Aluminum Mfg. Co. v. General Elec. Co.*, No. 4:90-CV-143, 1993 WL 725569, (W.D. Mich. 1993) (granting consultant's motion for summary judgment and holding consultant lacked "requisite relationship" with neighbor sufficient to create any legal obligation).

<sup>89</sup> *Daigle v. Shell Oil Co.*, 972 F.2d 1527, 1530 (10th Cir. 1992). The plaintiffs sought "response costs" from Shell and the government for medical monitoring under § 107(a) of the Comprehensive Environmental Response, Compensation and Liability Act [hereinafter CERCLA] as well as damages from Shell under an "ultrahazardous activity" strict liability claim. The Court of Appeals for the Tenth Circuit granted the government's motion to dismiss all of the tort claims against it for lack of subject matter jurisdiction insofar as the cleanup activities fell under the discretionary function exception to their waiver of sovereign immunity. As to Shell's motions to dismiss, the court dismissed the CERCLA § 107(a) "response cost" claims, while denying dismissal of the "ultrahazardous activity" strict liability claim.

<sup>90</sup> *Caldwell v. Bechtel, Inc.*, 631 F.2d 989 (D.C. Cir. 1980). The Court of Appeals for the District of Columbia Circuit ruled that Bechtel owed Caldwell a duty of due care to take reasonable steps to protect him from the foreseeable risk of harm to his health posed by the excessive concentration of silica dust in the Metro tunnels.

<sup>91</sup> *Lopez v. Frontera Produce*, 13CV31951. The District Court of Colorado ruled that the consultant should have known that the audit would be used to identify conditions that led to the distribution of the contaminated cantaloupe. ## **QUARRIES IN OTHER JURISDICTIONS – AIR & NOISE**

Quarries in South Australia and Western Australia must comply with the following setback requirements for *air* and *noise* quality, with a greater setback imposed if blasting is involved:

*[S]eparation of 500 metres based on “air” (South Australia) or 1,000 metres (Western Australia) to 3,000 metres (South Australia) based on “noise” if blasting is involved [p. 53].*

Quarries are a contentious land use, and, according to the Medical Officer of Health for the Halton Region Health Department,<sup>92</sup>

*Human health impacts from exposure to particulate matter (PM<sub>10</sub>: particulate matter, including coarse particulate, less than 10 microns, and PM<sub>2.5</sub>: fine particulate matter less than 2.5 microns) are well documented (see Appendix 1) and from a health protection perspective it is important to know not just the maximum air levels, but also how frequently high levels of particulate matter occur and how long they last [p. 53].*

Poor air quality can affect all people, but

*it is the young, the elderly, and those with existing health problems who are more likely to become ill, be hospitalized, or to die prematurely in response to poor air quality [p. 2].*

For the protection of human health and sensitive receptors, Halton Region’s Medical Officer of Health recommends that quarry applications include,

*a modelled frequency and duration analysis, which includes PM<sub>2.5</sub> (to understand how frequently and how long air levels can be expected to approach the maximum air levels); and*

*background air concentrations of PM<sub>2.5</sub> in the modelling analysis (to enable the assessment of additional emissions from the quarry and a comparison to the Canada Wide Standard which is an ambient air standard) [p. 53].*

## **Analogous Setback Requirements – Wind Farms**

In *Wainfleet Wind Energy Inc. v. Township of Wainfleet*,<sup>93</sup> the court addressed a municipality’s jurisdiction in enacting by-laws. The Township passed a by-law pursuant to the *Municipal Act, 2001*[7] setting out three restrictions against the construction, erection or operation of any Industrial Wind Turbine (IWT):

1. *Minimum setback of 2 kilometres from any property measured from the tip of the rotor blade in horizontal position;*
2. *Noise emitted by the IWT not to exceed 32dB at the nearest property; and*
3. *The Developer to provide an indemnification of 100% for any loss of property value or adverse health effect directly or indirectly caused by an IWT.*

The substance of the by-law deals with *setback* and *noise*, two of the many issues encountered when processing permit and licence applications from the aggregate industry.

<sup>92</sup> Bob Nosal, “Protecting Health: Air Quality and Land Use Compatibility,” *Halton Region Health Department*, 2009. < [https://opha.on.ca/OPHA/media/Resources/Resource%20Documents/AirQuality\\_LandUse-Feb09\\_2.pdf?ext=.pdf](https://opha.on.ca/OPHA/media/Resources/Resource%20Documents/AirQuality_LandUse-Feb09_2.pdf?ext=.pdf)> retrieved 2019-11-17.

<sup>93</sup> *Wainfleet Wind Energy Inc. v. Township of Wainfleet*, 2013 ONSC 2194 (CanLII), <<http://canlii.ca/t/fx2wd>>, retrieved on 2019-12-23.

*Property* is defined in the by-law to mean “*property line, vacant land, dwelling or structure and their inhabitants of all species used for private or business or public purposes.*” With the exception of *property line*, the balance of the terms lack clarity. Accordingly, the court ruled the by-law invalid for “vagueness” and “uncertainty,” as the other terms relating to “property” defied the court’s ability to “provide a basis for legal debate and reasoned analysis.”

However, the court recognized that municipalities may exercise both broad and specific powers pursuant to the *Municipal Act*, including the passing of by-laws provided they are not in conflict with provincial legislation.

*Subsection 8(1) of the Act requires municipal powers to be interpreted broadly “so as to confer broad authority on the municipality to govern its affairs as it considers appropriate and to enhance the municipality’s ability to respond to municipal issues [para. 27].”*

*Subsection 11(2) states that a municipality is empowered to pass by-laws concerning its economic, social and environmental well-being and the health, safety and well-being of persons [para. 28].*

*Subsection 128(1) provides that a municipality may prohibit and regulate matters that in the opinion of council are or could become or cause public nuisances. As well, Section 129 entitles a municipality to prohibit or regulate noise and vibration [para. 29].*

As for the applicant’s contention that the by-law is in effect a zoning by-law masquerading as one focused on *health, safety, noise and nuisance*, arguing that the *Planning Act* prohibition should apply, the court responded as follows:

*Although setback distances and control over the construction of structures is often a zoning matter, there is no reason why parallel jurisdiction cannot exist between the *Planning Act* and the *Municipal Act, 2001* when different considerations are engaged.*

As noted by the court, the province has relied on significant scientific evidence and public consultation in arriving at the 550-metre minimum setback distance for IWTs from *noise receptors*,<sup>94</sup> as defined in Section 4, Regulation 359/09 of the *Environmental Protection Act*. Ontario’s Divisional Court<sup>95</sup> has reviewed and approved the process establishing setback requirements for IWTs, and noted that if anyone wishes to challenge a proposed project based on health concerns, they can do so as part of the provincial application process.

Independent studies or consultations have not been undertaken by the province in connection with the risk and potential adverse effects occasioned by blasting quarries, even though they share some of the same concerns involving IWTs. But, as documented in other jurisdictions, the adverse effects, including flyrock, from quarry blasting can often have

---

<sup>94</sup> *Noise Receptor* locations are the centre of a building or structure containing one or more dwellings; centre of a building used for institutional purpose, including educational facility, a child care centre, a health care facility, a community centre or a place of worship; centre of a proposed building or structure (as previously mentioned) for which a permit has been issued; a location on an accessible lot zoned to permit a building or structure (as previously mentioned) where a building would reasonably be sited, having regard to the zoning by-law and the typical building pattern in the area; and a portion of a property that is used as a campsite or campground at which overnight accommodation is provided by or on behalf of a public agency or as part of a commercial operation.

<sup>95</sup> *Hanna v. Ontario (Attorney General)*, [2011] O.J. No. 944 (Div. Ct.) at para. 29. <<http://canlii.ca/t/2g1bl>>, retrieved on 2019-12-23.

much greater impacts on the environment and the health and safety of the public, warranting a setback greater than 550 metres.<sup>96</sup>

### ***Cascading Effects and Hazards of Quarrying Stone in Karst***

The consequences of quarrying for stone in a karst terrain are generally environmentally catastrophic and irreversible, with the series of adverse effects felt well beyond the limits of the quarrying operation:

*In karst environments, aggregate mining may alter sensitive parts of the natural system at or near the site thus creating cascading environmental impacts (Langer and Kolm, 2001). Cascading impacts are initiated by an engineering activity, such as the removal of rock, which alters the natural system. The natural system responds, which causes another impact, which causes yet another response by the system, and on and on. For example, aggregate mining in some karst might lower the water table, which will remove the buoyant support of rock that overlies water-filled caverns or other solution features, which might result in land collapse, which will create a sinkhole. Cascading impacts may be severe and affect areas well beyond the limits of the aggregate operation. Cascading impacts may manifest themselves some time after mining activities have begun and continue well after mining has ceased. Many of the impacts described below are cascading impacts.<sup>97</sup>*

*...[A] common thread [of a karst terrain] is the dominantly subterranean drainage. The paucity of water flowing at the surface, a consequence of rapid infiltration underground through a network of discontinuities in the soluble rock mass, results in two important but contrasting points: the considerable value of karst water resources (representing about 25% of the drinkable supply in the world) is strongly counteracted by the ease with which human activities can negatively impact this precious resource. The same narrow discontinuities, and the larger dissolution conduits and karst caves, are the main pathways through which potential pollutants may travel swiftly to regional groundwater bodies, or directly to springs.*

*Contaminants can be introduced by means of dispersed infiltration as well as from point sources and are frequently transmitted with minimal filtering. This example, just one of the many natural and/or anthropogenic hazards that may affect karst areas, illustrates the fragility of karst environments. Their high vulnerability is further expressed by a very simple concept that is true for many other environments but probably shows its best evidence in karst: it is very easy to damage or destroy natural resources but restoration to a pristine situation is an extremely difficult and commonly impossible, task. Where some degree of remediation is possible, the economic cost is commonly very high.<sup>98</sup>*

*Estimating and mitigating potential risk prior to quarrying are difficult. Some geotechnical techniques may be unreliable owing to a high degree of anisotropy and heterogeneity in carbonate rock where secondary porosity (fractures) and tertiary porosity (dissolutionally enlarged openings)*

---

<sup>96</sup> The Divisional Court's confidence in the testing that resulted in the regulated setback requirement of 550 metres may be unwarranted, as the 2016 CCSG study (Buffer Zone Considerations For Mining Development In Proximity To Human Populations) at p. 16-22 citing Wind Turbine Buffer Zones compiled by Ontario Wind Resistance documents 50 jurisdictions, only one of which, Clinton Town Council, New York, has a lesser setback of 318 metres, but it comes with a Property Value Protection Plan within five miles of the Potential Project Impact Area to be provided by the applicant.

<sup>97</sup> William H. Langer, "Potential Environment Impacts of Quarrying Stone-A Literature Review," U.S. Department of the Interior and U.S Geological Survey (Version 1.0 2002). <https://pubs.usgs.gov/of/2001/ofr-01-0484/ofr-01-0484po.pdf>. For a detailed overview of environmental issues associated with Karst, see *Living With Karst: A Fragile Foundation* published by the American Geological Institute, <https://www.americangeosciences.org/sites/default/files/karst.pdf>.

<sup>98</sup> M. Parise and J. Gunn, "Natural and anthropogenic hazards in karst areas: an introduction," *Geological Society, London, Special Publications*, (Volume 279, January 2007): 1-3. <https://sp.lyellcollection.org/content/279/1/1>.

are the dominant avenues for groundwater circulation. Surficial geophysical investigative techniques, (e.g. electrical resistivity, ground-penetrating radar, seismic response, mapping of lineaments, etc.) are useful in characterizing a site in general terms, but they are rarely definitive. Borehole logging and geophysics, although very precise within each well, may not reflect the true nature of secondary and tertiary porosity within the footprint of the quarry. For similar reasons, pump tests conducted in wells that do not adequately represent the karst aquifer (i.e. intersect secondary and tertiary porosity) likely will not provide reliable data for environmental and risk assessment.<sup>99</sup>

...[W]e have investigated karst and collapse sinkholes at quarries in Paleozoic dolomitic limestone which have experienced flooding following a routine blasting event. In one example, flood waters entered through the floor of the quarry from a source that was initially unknown, but later determined to be a conduit connecting the quarry with a karst cavern network outside the pit and extending to a nearby river. Immediately following the blasting event, inflow originated from the dewatering of the karst aquifer, at a rate of about 15,000 gpm. The inflow carried with it eroded karst-fill from the cavern network and the sediment was deposited onto the quarry floor. Over a period of several weeks the inflow was observed to decrease corresponding to the rapid decline of the water table within the karst aquifer. Large areas of the limestone aquifer contained little or no karst and in these areas the water was unaffected by the inflow from karst. A water storage basin located between the quarry and river received pumpage from the flooding quarry and was observed to drain rapidly into a new sinkhole. This drainage may have led to further erosion of the interconnected subsurface voids, enlarging the continuous connection between the river and the pit, which we call the “**conduit**.” Subsequent river inflow to the pit further eroded fill material from the conduit and the rate of inflow was observed to increase over the next several months to over 40,000 gpm.<sup>100</sup> [emphasis added]

The creation of permanent barriers by attempting to construct grout curtains across the **conduit**, has proven to be a technically challenging [and costly] problem. Our observations of grouting [quarry] remediation projects found them to be trying for both the site owner, and the engineering firm implementing the remedy. The primary challenges lie in the erodeability of the soft sediment which remains in the cavern during the placement of a grout plug. During remediation, the plug material (e.g., roofing tar or cement grout) conforms to the surfaces of the fill material in the cavern, temporarily stopping the flow. Fissures immediately form in the soft sediment against the grout curtain. Water flowing through the fissure erodes the soft sediment leaving the plug suspended in sediment and useless. Attempts at forcing grouts (cement-type suspension grouts) into these fissures prior to placing the plug material into the flow conduit are only occasionally successful.<sup>101</sup> [emphasis added]

A 2005 study of pits and quarries in Minnesota<sup>102</sup> identified a number of adverse hydraulic impacts associated with limestone quarries, examples of which are described as follows:

*Two examples of the impacts of limestone quarries that require dewatering can be found in southeastern Minnesota. At Owatonna, Minnesota, the Fretham and Lundin quarries mine below the water table in the Galena limestone and are dewatered for mining. Between 1985 and 1992,*

<sup>101</sup> Ibid (see Figure 4 – Remediation Costs vs. Quarry Inflow). “The cost of remediation of sinkholes and flooding inflows is staggering as compared to quarry revenues.”

<sup>102</sup> J.A. Green, J.A. Pavlish, R.G. Merritt, and J.L. Leete, Minnesota Department of Natural Resources, Division of Waters, for the Legislative Commission on Minnesota Resources, 2005, <https://files.dnr.state.mn.us/publications/waters/hdraulic-impacts-of-quarries.pdf>.

DNR Waters staff received several complaints about wells near the quarries going dry or losing pressure. (Pressure loss can be a symptom of a water level that has dropped too close to the level at which the pump is set. Drawdown during active pumping then brings the water level to the pump intake causing the pump to suck in air.)

The investigation determined that these wells were also in the Galena limestone and were in fact being impacted by the dewatering. In order to resolve the issue, the quarry operators paid to have the homes connected to the City of Owatonna's water system. A second example is the Osmundson quarry in the Lithograph City Formation at LeRoy, Minnesota. This below water table quarry requires seasonal dewatering at 250 gallons per minute to 800 gallons per minute. When the quarry is being dewatered, Sweets Spring, approximately 325 yards to the southeast, stops flowing. Dye traces in 1993 and 1994 verified that the quarry pirates the ground-water flow to the spring.

### ***Potential Adverse Effects of Dewatering in Karst Environment***

In 2003, the Environment Agency responsible for protecting and improving the environment in England and Wales undertook a comprehensive study of how to assess the hydrological impact of groundwater abstractions in connection with dewatering operations at quarries, mines and engineering works.<sup>103</sup> In certain hydrological settings, in particular a karst terrain, there are a number of considerations that have to be taken into account when undertaking an Hydrological Impact Appraisal (HIA), as there are greater risks of adverse environmental impacts.<sup>104</sup> When assessing groundwater extraction, it is not reasonable to pretend a karst aquifer is homogeneous and isotropic (i.e., having identical values in all directions) (see Appendix 3).

*Karst and fractured crystalline rock: Care needs to be taken when dealing with groundwater abstraction from karstic aquifers and fractured crystalline rock. **The assumptions inherent in analytical equations such as those of Thiem and Theis usually break down, and it is no longer reasonable to pretend the aquifer is homogeneous and isotropic** (see Appendices 3 and 4) [p. 39]. [emphasis added]*

*Karst: dissolutional features such as conduits, caves, sinkholes, and closed depressions can develop in any soluble rock type, including carbonate rocks such as limestones and dolomites, and evaporites such as gypsum, anhydrite and halite. Such dissolutional features give an aquifer karstic properties, and the assumptions built into many models and analytical equations (that the aquifer is homogeneous and isotropic, for example) break down. **There is far greater uncertainty when predicting impacts or interpreting monitoring data in karstic aquifers, and a slightly different approach to HIA** [p. 15]. [emphasis added]*

*The subject of karst is introduced under Settings 1 and 3 in Figure A2.1. The development of karstic features in carbonate rocks can have dramatic effects on their hydrogeological behaviour. **When trying to predict the hydrogeological impacts of dewatering, the level of uncertainty encountered when dealing with karstic aquifers may be an order of magnitude greater than for most non-karstic aquifers. It will be seen later (in Appendix 3) that great care needs to be taken when developing conceptual models for quarries or mines in karstic rocks** [p. 77]. [emphasis added]*

*Karst terrains are the product of enhanced groundwater circulation that has developed preferentially due to the solubility of the terrain. They can develop in any soluble rock type including carbonate rocks such as limestones and dolomites, and evaporites such as gypsum, anhydrite and rock salt*

<sup>103</sup> Boak R, Bellis L, Low R, Hayes P, McKelvey P, Neal S, "Hydrogeological impact appraisal for dewatering abstractions," Environment Agency, © 2007. [https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment\\_data/file/291080/scho0407bmae-e-e.pdf](https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/291080/scho0407bmae-e-e.pdf).

<sup>104</sup> Appendix 3 (pages 81-117) of the study is devoted entirely to the potential impacts of dewatering in Karst terrains.

(halite). Where any of these rocks are present, the underlying groundwater system may be karstic in nature. **Given the high vulnerability of karstified aquifers and the considerable difficulties in predicting the effects of groundwater abstractions in them, the precautionary principle indicates that groundwater systems developed in these rock types should be considered as karstified until this is proven not to be the case [p. 81]. [emphasis added]**

Karst terrains can often be recognised by the presence of a distinctive suite of landforms including: limestone pavements and other small-scale surficial and sub-soil dissolution forms (termed karren), sinking streams, blind and dry valleys, closed depressions of a variety of sizes and origins, caves and springs (Quinlan et al 1991). Of these, the closed depression and dry valley are perhaps the most useful general indicators of karst.

**...[A]lthough the presence of a distinctive karst morphology may indicate that the associated aquifer is actively karstic, this need not necessarily be the case. However, the precautionary principle should again be applied, with the aquifer assumed to be actively karstic unless it can be shown that it is not [p. 81]. [emphasis added]**

Karst groundwater systems are unusual because they develop channel or conduit flow, that can give rise to very rapid and highly localised movement of groundwater. In carbonate rocks, there is a strong non-linearity in the rate of dissolution as chemical equilibrium is approached, so that some under-saturation persists if there is significant flow, allowing continuous dissolutional enlargement of the openings through which groundwater flows. Thus, any initially open pathways such as joints or bedding planes through which groundwater flows may be subject to dissolutional widening (Worthington 1999). Such enlarged channels are frequently organised into a dendritic, hierarchical, tributary network that feeds to major springs (Figure A3.1) (Bakalowicz et al 1995). Such hierarchical channel networks result from the strong positive feedback between the circulation of fluid and the rate of dissolution, which is primarily dependent on groundwater flux. Thus flow routes with large discharges tend to develop most rapidly, and capture flow from adjacent smaller openings that have higher heads, building a dendritic tributary network very similar to that of surface water drainage. Indeed, this analogy can be extended because, like surface rivers, springs fed by karst conduits can often have well-defined underground catchments, although these do not necessarily conform with the surface topography [p. 82].

**...In carbonate aquifers, where dissolution is driven primarily by carbonic acid derived from the elevated carbon dioxide (CO<sub>2</sub>) concentrations present in the soil atmosphere (resulting from root respiration and bacterial decomposition of organic matter), this zone may be particularly pronounced. It is termed the epikarst aquifer or subcutaneous zone (Figure A3.1). In contrast to conventional aquifers, in karst there is substantial storage and redistribution of recharge within the epikarst aquifer (Williams 1983; Smart and Friederich 1986). Failure to recognise the significant contribution of this zone to the hydrological behaviour of the karst groundwater system can lead to substantial errors in forward predictions. There are however considerable difficulties in developing techniques to evaluate the importance of the epikarst aquifer at any individual site, and in the incorporation of its behaviour in predictive models [p. 82]. [emphasis added]**

Karst aquifers are best considered as triple-porosity aquifers, although in some aquifers the smallest scale openings may not be hydrologically significant (Quinlan et al 1996; Worthington 1999). At the smallest scale is matrix porosity, comprising intercrystalline and inter-granular pores of small diameter (50-500 µm). At the intermediate scale are fractures that have experienced little or no dissolutional enlargement and have typical widths of <1 mm. Because of their small apertures, flow is laminar in both these types of opening. However, at the largest scale of dissolutional channels, apertures range from several millimetres in dissolutional fissures to metres in cave conduits, and under most head conditions flow is turbulent. **The development of turbulent flow in karstic channels is important because it allows sediment transport by groundwater flow, which may impact upon water quality. More significantly, flow can no longer be described using Darcy's Law (which applies only to laminar flow) and conventional approaches to groundwater flow modelling are inappropriate [p. 82]. [emphasis added]**

The nature and type of impacts of groundwater abstraction in karst aquifers (which exhibit groundwater flow in conduits) differ from those in aquifers where groundwater flow is predominantly intergranular in a number of ways:

- *Impacts on groundwater levels and flows: these are often of a much greater magnitude, because of the very high transmissivities of the conduits. The impacts also tend to be irregularly distributed, because of the highly heterogeneous distribution of transmissivity in karst aquifers. Larger impacts occur along the line of (and in the vicinity of) conduits, including at springs where the conduits discharge – potentially a long way from the dewatered excavation. Smaller impacts occur in areas more distant from conduits where intergranular and small fracture flow dominate – potentially quite close to the excavation being dewatered.*
- *Ground subsidence and collapse: lowering of groundwater levels can cause ground subsidence and collapse in karst terrain. Reduction of pore (or larger void) water pressures causes an increase in the effective stress borne by the aquifer or overlying materials (solid phase), and if the increased effective stress exceeds the strength of these materials, subsidence or ground collapse will occur. The collapse feature usually takes the form of a closed depression, called a sinkhole or doline. **Subsidence and formation of sinkholes in karst terrain can occur naturally or it can be human-induced through groundwater abstraction. However, Newton (1976) showed that, of an estimated 4,000 sinkholes formed in Alabama between 1900 and 1976, only 50 (about 1 per cent) were natural collapses [and that 99% (3,500) of the collapses are associated with ground-water declines caused by the withdrawal of large quantities of water by high yield wells and by pumping from quarries and mines.]. [emphasis added]***
- *Within aquifer' impacts: in contrast to aquifers where intergranular flow dominates, karst aquifers can contain features of geocological value. These include rock-forms (such as speleothems) and hypogean fauna. Groundwater abstraction can endanger the favourable hydrological conditions for the formation and maintenance of these features.*

### **Prediction of hydrogeological impacts in karst**

For HIA, the critical issue is to determine whether or not conduit flow is occurring in the aquifer. Where conduit flow is present, most analytical equations and conventional groundwater modelling strategies are inappropriate and, if they are used, predictions of impacts will be highly uncertain. If conduit flow is not present, then more conventional techniques may still be applicable. It is worth emphasising again that, in the context of HIA, there should be a high burden of proof on a conclusion that conduit flow is not a feature of a groundwater system. The criteria that may be used to recognise aquifers that have conduit flow are as follows [p. 86]:

- *Recharge to the aquifer occurs at discreet sink points.*
- *Hydrologically active caves are known from the area.*
- *Discharge from the aquifer is limited to a few discreet springs.*
- *The rate of groundwater movement, determined by tracer tests, is high (Figure A3.5).*
- *Tracer detection in observation wells is focussed at specific sites, rather than forming a general breakthrough curve.*
- *Flow in the aquifer is turbulent, as indicated by the calculated Reynolds number, or transport of suspended sediment to the springs.*
- *Under baseflow conditions, linear troughs are present in the piezometric surface mapped from boreholes*
- *Hydraulic gradients tend to decrease in a down-gradient direction in karst groundwater systems, whereas they tend to increase in non-karst (intergranular flow) systems. Such a pattern also implies a down-gradient increase in hydraulic conductivity.*
- *There is a non-linear relationship between spring discharge and water level observed in boreholes.*
- *There are abrupt changes in water quality at springs during recharge events.*
- *There are rapid changes in water levels in boreholes following rainfall (more indicative of concentrated recharge and conduit flow in unsaturated zone than in saturated zone).*

- There are very large differences in the hydraulic conductivity determined at different scales within the aquifer.
- There may be marked differences between the isotopic and geochemical characteristics of water sampled from individual boreholes, and between these and springs.
- There is an anisotropic and heterogeneous response of observation boreholes to abstraction.
- There are non-linear relationships between drawdown in observation wells and the rate of abstraction from a pumping well.

***It is important to recognise that with the possible exception of the results of tracer tests, none of these criteria provides an unequivocal indication of conduit flow behaviour, but where several of the criteria are met, the balance of interpretation should lie firmly in this direction.*** [emphasis added] To understand further the nature and application of these criteria, the reader is referred to two papers that provide contrasting (karst and non-karstic) interpretations of the hydrology of the Smithville PCB spill site [see comments below] in the Silurian Dolomites of the Niagara Escarpment, Ontario, Canada (Worthington 2002 and Zanini et al 2000).<sup>105</sup> There is also an interesting series of papers that debate the contribution of conduit flow in the very important Edwards Aquifer of Texas, USA (Halihan et al 2000; Mace and Hovorka 2000; Worthington 2002).<sup>106</sup> The consequences of incorrectly accepting the non-karst model are graphically illustrated by problems associated with the construction of interceptor sewer tunnels in Milwaukee, Illinois (Rovey and Cherkauer 1994,<sup>107</sup> Burke 2002; Day 2004).

“Smithville PCB cleanup proposals weighed after \$50 million and 15 years, Hamilton Spectator, Nov 5, 2015.” [As reported in the article,] “a five-star cleanup of...[the] toxic-waste site in Smithville is out of the question because it would cost \$500 million...says...[the] program manager of the Smithville Phase IV Bedrock Remediation Program...[of] a final plan for the site for the next 50 years....It’s thought about 10,000 to 30,000 litres [of toxins] leaked into the ground and there is no known way to remove it cheaply. Also unknown are how best to contain it and how it moves in fractured rock....If the site is left as is, the fractured limestone will continue to allow water to pass over toxic material, picking up some PCBs....It currently costs \$500,000 a year for the monitoring and containment of the polluted site....International attention, particularly from the United States, is focused on Smithville. Solutions found there could be applied worldwide, including at least 40 toxic sites in the Niagara region, says Bill Wertz, an engineering geologist with the State Department of Environmental Conservation. No one has figured out what to do beyond just leaving sites alone and containing them to some degree with underground walls....The U.S. Environmental Protection Agency has contributed \$500,000 to Phase IV...[and] the money is being used by University of Waterloo...to determine underground water flow....Over 15 years, just 14 kilograms of PCBs have been removed by pumping water from the site into filters....Drill tests show the oil has spread several hundred metres from the site through fractured rock to a depth of about 21 metres or more....At first it hurt town real estate, but that has bounced back. Because the spill was near a town well, water is now brought by pipe from Grimsby, which was to some, a benefit of the disaster.

*[MNRF is committed to the 11 principles in the “Statement of Environmental Values”<sup>108</sup> when decisions that might significantly affect the environment need to be made, including the principle that “from both a sound business and environmental perspective, it is less costly and more effective to anticipate and prevent environmental impacts before undertaking new activities than it is to correct environmental problems after the fact.” When decisions that might significantly affect the environment have to be made, MNRF “will take into account social, economic and other considerations.”]* [emphasis added]

*Great care is needed when using information from boreholes. Water level and aquifer properties such as transmissivity determined from boreholes are unlikely to reflect conditions in the conduit flow part of the aquifer as the probability of a borehole intersecting a conduit is very low. Worthington (1999) estimates the probability is between 0.0037 and 0.075 (based on maps of ten extensive cave systems), but this probably represents an overestimate, as the surveys include dry passage no longer actively involved in groundwater flow, and the examples are drawn from areas known to be highly cavernous. Thus, data from boreholes are likely to be unrepresentative and unreliable (especially if used to develop and test numerical models). In contrast, springs in carbonate aquifers are the natural output points for the conduit network, and thus provide a sampling point indicative of its behaviour. In terms of aquifer contamination, they also integrate conditions over a large area, and are thus more useful as sampling points than boreholes, the catchments for which are poorly known (and usually exclude the conduit system) [p. 87].<sup>109</sup>*

In 1987, the United States Department of the Interior in cooperation with the Erie County Department of Environment and Planning investigated the ground-water-level declines in the Onondaga Aquifer in Eastern Erie County since 1982.<sup>110</sup> The study found that dewatering in quarries had a significant impact on water levels surrounding the quarries, and caused a number of wells to go dry. Dewatering in the quarries was also responsible for the development of sinkholes.

*Ground-water levels in the Onondaga aquifer declined during the fall of 1981 and summer and fall of 1982-85 near a 2.2-mile-long and 800-foot-wide land-surface depression in the eastern part of Erie County. More than 60 wells and several wetlands went dry, and at least three sinkholes developed. Ground-water levels were measured in 150 wells during a high-water-level period in April 1984 and a low-water period in October 1984. Water levels fluctuated 20 to 50 feet near the depression and near quarries but fluctuated only 5 to 10 feet elsewhere. The water-level decline is caused by the combined effect of ground-water removal by pumpage from a quarry (the water is then discharged to Dorsch Creek) and by the diversion of some water of Dorsch Creek since 1981 away from swallets [underground streams] in the 2.2-mile-long depression area, which are recharge points for the aquifer. In 1982, sinkholes formed in a surface-depression area in Harris Hill. The enlargement of sinkholes in the Harris Hill area seems unrelated to the water-level decline in the eastern part of the county and is probably caused by local drainage alterations [p. 1].*

*The area where water levels declined is underlain by the Onondaga Limestone an important aquifer that, in eastern Erie County, supplies water to approximately 750 households, 20 commercial and industrial facilities, and many farms. The Onondaga aquifer is a major source of water supply elsewhere in New York State (fig. 1) and is particularly important because it provides water of suitable quality for most uses. Water in the underlying Akron and Bertie Dolomites and Camillus Shale is less desirable for most uses because it contains elevated levels of hydrogen sulfide and dissolved iron and manganese [p. 1].*

---

<sup>109</sup> “Unlike an array of boreholes, an excavated quarry will intersect every fracture within its volume and footprint (Figure 5)....[W]here there is an appreciable flow of groundwater in fractures, water will enter the quarry pit and...eventually flood the excavation to the level of the surrounding potentiometric surface. If water is continually pumped from the pit during quarrying activities, and if inflow is not impeded by grouting or other measures, groundwater will continue to flow toward the quarry. This will result in lowering of the potentiometric surface within the zone of influence and may lead to reversal of flow direction in outlying parts of the aquifer. Nearby surficial water bodies (lakes, ponds, reservoirs, streams) may then lose water to the quarry through the fracture network (Figure 6). In a worst-case situation, excessive discharge into the quarry from contributing fractures may render the operation logistically or economically untenable (Kastning 2008). *Quarrying in Karst: Geotechnical Estimation of Environmental Risk*, Conference Paper 11th ASCE Multidisciplinary Conference on Sinkholes and the Engineering and Environmental Impacts of Karst.

<sup>110</sup> Ward W. Staubitz and Todd S. Miller, “*Geology and Hydrology of the Onondaga Aquifer in Eastern Erie County, New York, With Emphasis on Ground-Water-Level Declines Since 1982*,” <https://pubs.usgs.gov/wri/1986/4317/report.pdf>.

The walls of quarries show where prominent joints occur in the Onondaga Limestone. A quarry in the southwestern part of the study area (pi. 1) has large seeps of water from two prominent bedding planes; one was observed on top of the cherty Clarence Member (altitude about 625 ft), and the other was reported by the quarry operator to be at the base of the Onondaga (altitude 565 ft), where water cascades into a sump pit [p. 20].

Most vertical joints extend several tens of feet laterally, but some extend for several miles. A quarry that previously occupied the site of Spaulding Lake, north of Main Street in the Town of Clarence (pi. 1), was abandoned when mining intercepted a major vertical joint from which large volumes of water flooded the quarry. The joint's trend is N43°W and is traceable on air photos from the escarpment at County Route 216 (Old Goodrich Road) to Tillman Swamp [p. 20].

Quarries. Pumping for dewatering at three quarries that mine the Onondaga Limestone results in significant ground-water discharge from the Onondaga. Two quarries are in the southwestern part of the study area, and one is in the eastern part (pi. 1). Two quarries are pumped all year (the eastern and extreme southwestern quarries); the other is not pumped during the summer and early fall, when ground-water levels are below the quarry floor. Water pumped from the two southwestern quarries is discharged to Ellicott Creek through drainage ditches (pi. 1), and water pumped from the eastern quarry is discharged into Dorsch Creek, which flows 5.0 mi southwestward to Ellicott Creek [p. 28].

The daily average pumpage from the quarry in the eastern part of the area (at the Genesee-Erie County border) from June 1984 to July 1985 was 5.3 Mgal/d. Water levels indicate a 5- to 25-ft-deep cone of depression within 1,000 ft of the quarry (pi. 3). Ground water flows into the quarry from the north, east, south, and southwest. On July 24, 1985, water levels in wells within 500 ft of the quarry ranged from 784 to 788 ft above sea level. Since quarry operations began in 1958, several wells close to the quarry have been deepened (pi. 1) because pumping from the quarry had caused the water level to fall below the pump intakes. Projecting the regional hydraulic gradient of unaffected areas to the quarry indicates that the natural water levels in the area would be 800 to 810 ft above sea level during the summer. Without the pumping, the natural direction of ground water flow would be northwestward and westward [p. 28].

The pumping has lowered ground-water levels by 5 to 35 ft within 3,000 ft of the quarries (pi. 3). During the winter, when the pumps are shut down at the quarry east of Barton Road, water levels rise to altitudes from 700 to 710 ft (Todd Giddings and Associates, 1980), which is 5 to 15 ft below land surface [p.28].

Water levels in parts of the Onondaga aquifer declined during the fall of 1981, and several wells became dry. Water levels declined again during the summer and fall of 1982-85, and more than 60 wells and several wetlands became dry. The depth of wells that went dry ranged from 30 ft to 77 ft and averaged 50 ft. Most of the wells that went dry were deepened another 25 to 80 ft; the average was 45 ft. The depth of redrilled wells now ranges from 72 to 130 ft and averages 95 ft. Most of the deepened wells are completed in the lower part of the Onondaga, but several of the deeper ones are in the Akron and Bertie Dolomites [p. 30].

The water-level measurements revealed that water levels declined 30 to 50 ft during the summers and falls of 1982-85 in the vicinity of the channellike depression in the eastern part of the study area and in an apparent extension of the channel into the central part of the study area. Water levels elsewhere declined less than 10 ft. Most of the wells that became dry and were redrilled since 1981 are within 2,500 ft of the center of the depression and extend as a belt at least 3 mi long from Ayers Road to North Millgrove Road (pi. 4). The channel may extend west another 2 mi to Tillman wetland, but west of North Millgrove Road it may be buried by unconsolidated deposits [p. 30].

Causes of water-level declines in the channellike depression area....Before the quarry at the Erie-Genesee County line was opened, ground water flow probably followed land surface and the direction of surface drainage westward and northwestward to and then beneath the channellike depression. Although the quarry is upgradient of the depression area and intercepts some of the ground water that would have flowed to it, no significant water-level declines were reported west of the quarry from 1958 to 1981. However, at least part of the water pumped from the quarry and discharged to Dorsch Creek during this period flowed northwestward in a small channel that

branches off Dorsch Creek near Ayers Road; the water then flowed back into the Onondaga aquifer through several swallets in the easternmost extension of the depression area (fig. 6). Some of the water pumped from the quarry was, in effect, returned to the aquifer through the swallets in the channellike depression and thus did not constitute a major loss from the system. During the summer of 1981, however, channel clearing routed all flow in Dorsch Creek southwestward, away from the swallets in the channellike depression area. Since then, all quarry pumpage carried by Dorsch Creek has flowed into Ellicott Creek and none flows through the now-abandoned channel to the swallets. Therefore, since 1981, none of the water removed from the quarry returns to recharge the ground water in the Onondaga aquifer in the depression area [p. 30-31].

Shortly after the 1981 diversion of water in Dorsch Creek from the swallets, several wells near the channellike depression were reported to go dry. During the summers and falls of 1982-85, ground-water levels near the depression again declined, but more severely than in 1981, and caused several wetlands and more than 60 wells to go dry. The diversion of recharge away from the depression area evidently has stressed the equilibrium of this part of the aquifer and caused a loss of storage in the aquifer, as reflected by the water-level declines. The reason that ground-water fluctuations near the depression are greater than in the surrounding areas is that the bedrock within the channel area has a high density of solution-widened joints and is therefore more permeable than elsewhere.

Causes of water-level declines near the quarries. Water levels declined 5 to 30 ft in the vicinity of the three quarries as a result of the dewatering operations. The seasonal dewatering affected water levels within a 3,000-ft radius of the western quarries and within 1,000 ft the eastern quarry. Several wells near the eastern quarry (at the Erie-Genesee County line, fig. 1) had to be deepened as a result of water-level declines after the quarry began operation in 1958 [p. 32].

Although sinkholes have developed naturally throughout geologic time, they have formed with increased frequency in the past 50 years as a result of large ground-water withdrawals. For example, in some areas underlain by carbonate rocks in Alabama, where sinkhole formation has been extensively studied, an estimated 4,000 individual sinkholes and areas of subsidence have developed since 1900 (Newton, 1977). All but about 50 of these are defined as human-induced sinkholes and are associated with ground-water declines caused by the withdrawal of large quantities of water by high-yield wells and by pumping from quarries and mines (Newton, 1976) [p. 32].

The formation of sinkholes is usually preceded by or coincident with the lowering of ground-water levels or an increase in the range of water-table fluctuations. Initially, when the water levels are high, solution-widened openings are filled with water and residual particles of chert, clay, and other insoluble minerals as well as particles from overlying unconsolidated deposits. Both the water and residual material in the solution-widened openings serve to support the overlying bedrock and unconsolidated deposits, and their presence tends to restrict infiltration of water from above. When ground-water levels are lowered, such as through heavy pumping, the potentiometric gradient is increased, and the velocity of ground-water flow accelerates toward the discharge area, which results in the dewatering of the openings and subsurface erosion of the residual material within them (Newton, 1977) [p. 32-33].

The loss of structural support (hydrostatic pressure) in the solution-widened openings and in pore spaces in unconsolidated deposits by evacuation of water may cause a collapse of the opening or collapse of unconsolidated sediments into openings of the underlying bedrock, which results in abrupt subsidence at land surface. If the unconsolidated deposits consist primarily of sand and gravel, this process generally results in a gradual subsidence at land surface that forms a depression with low-angle slopes, but if they consist of silt and clay, this process results in the sudden formation of steep-sided, conical sinkholes, as depicted in figure 7. Clayey silt or clay are relatively cohesive and can support a substantial weight, but as the sediment in the lower part of the deposit gradually spalls into the openings in the bedrock, a cavity is formed that becomes larger until the weight of overlying material can no longer be supported, at which time it collapses, forming a sinkhole [p. 33].

If unconsolidated clayey deposits above a vertical joint are subjected to repeated wetting and drying, such as by a widely fluctuating water table, desiccation cracks develop, and spalling will

occur more rapidly. An increased range of water-level fluctuations has been reported to be caused by seasonal dewatering of quarries and mining (Newton, 1976) and also by diversion of storm runoff into sinkholes (Reitz and Eskridge, 1977), both of which occur in Clarence [p. 33].

### ***Interference with Home Owners' Reasonable Use of Groundwater***

In 1982, Charles and Elsie Paul, along with fifty other plaintiffs filed a law suit against American Aggregates Corporation. The plaintiffs alleged that the corporation in the conduct of its business of quarrying limestone had caused the level of the water table in the artesian aquifer underlying the plaintiffs' land to drop, causing problems with both the *quantity* and *quality* of water in their wells. The Ohio appeals court found in favour of the owner of the quarry, applying the "English Rule"<sup>111</sup> of non-correlative rights with respect to groundwater in *Frazier*:<sup>112</sup>

*[T]here are no correlative rights existing between the proprietors of adjoining lands, in reference to the use of the water in the earth, or percolating under its surface. Such water is to be regarded as part of the land itself, to be enjoyed absolutely by the proprietor within whose territory it is; and to it the law governing the use of running streams is inapplicable.' Id. at 308.*

On appeal, the Ohio Supreme Court<sup>113</sup> overturned the lower court's ruling, recognizing the injustice of such a policy, stating, in part,

*If the English rule is to obtain, a man may discover upon his own land springs of great value for medicinal purpose or for use in special forms of manufacture, and may invest large sums of money upon their development; yet he is subject at any time to have the normal supply of such springs wholly cut off by a neighboring landowner, who may, with impunity, sink deeper wells and employ more powerful machinery, and thus wholly drain the sub-surface water from the land of the first discoverer."*

*"Traced to its true foundation, the rule is simply this: that owing to the difficulties the courts will meet in securing persons from the infliction of great wrong and injustice by the diversion of percolating [sic] water, if any property right in such water is recognized, the task must be abandoned as impossible, and those who have valuable property acquired by and dependent on the use of such water must be left to their own resources to secure protection for their property from attacks of their more powerful neighbors, and failing in this, must suffer irretrievable loss; that might is the only protection.*

The Ohio Supreme Court broke with precedent and applied a "reasonable use" doctrine to underground water (Restatement of the Law 2d, Torts, Section 858):

*(1) A proprietor of land or his grantee who withdraws ground water from the land and uses it for a beneficial purpose is not subject to liability for interference with the use of water by another, unless*  
*(a) the withdrawal of ground water unreasonably causes harm to a proprietor of neighboring land through lowering the water table or reducing artesian pressure,*

<sup>111</sup> *Acton v. Blundell* (Exch. 1843), 12 M. W. 324, 152 Eng. Rep.1223. See, also, Note, Establishing Liability for Damage resulting From the Use of Underground Percolating Water: *Smith-Southwest Industries v. Friendswood Development Company* (1978), 15 Houston L. Rev. 454.

<sup>112</sup> *Frazier v. Brown* (1861), 12 Ohio St. 294.

<sup>113</sup> *Cline v. American Aggregates Corp.*, 15 Ohio St. 3d 384 (Ohio) 474 N.C.2d 324, *aff'd*. *Cline v. American Aggregates Corp.*, 582 N.E.2d 1,7 (Ohio App. 10 Dist. 1989). An appeal from that decision was dismissed *Cline v. American Aggregates Corp.*, 550 N.E.2d 479 (OH 1990).

*b) the withdrawal of ground water exceeds the proprietor's reasonable share of the annual supply or total store of ground water, or*

*(c) the withdrawal of the ground water has a direct and substantial effect upon a watercourse of lake and unreasonably causes harm to a person entitled to the use of its water.*

The court ruled that the Restatement theory provides security that one's source of ground water cannot be usurped by a neighbor. A damaged property owner will be able to recover costs necessitated by the lowering of the water table. The party causing the harm will be liable for the damages. Ground water law has been profoundly affected by scientific advances and an understanding of hydrology.<sup>114</sup>

In *McNamara et al. v. City of Rittman, Hensley et al. v. City of Columbus et al.*,<sup>115</sup> the Ohio Supreme Court was asked to determine the certified question:

*Does an Ohio homeowner have a property interest in so much of the groundwater located beneath the land owner's property as is necessary to the use and enjoyment of the owner's home [para. 8]?*

The Supreme Court of Ohio answered the question affirmatively and ruled that,

*Ohio [recognizes that] landowners have a property interest in the groundwater underlying their land and that governmental interference with that right can constitute an unconstitutional taking [para. 34].*

This case followed *Cline v. Am. Aggregates Corp.*,<sup>116</sup> a landmark court ruling protecting landowners' property rights in groundwater:

*Through Cline, a property owner has a remedy against another property owner with land overlying a common aquifer, if the other landowner's use of the water unreasonably diminishes his water supply. Under Cline, a property owner's right to use the water underlying his property is not subject to a neighboring property owner's superior pumping system...[A] landowner's right to the water underlying his property is protected by law. A property owner has a potential cause of action against anyone who unreasonably interferes with his property right in groundwater. That cause of action arises only from the effect on the landowner's water rights -- no other effect on the overlying property is necessary for the cause of action to proceed.*

As pointed out in *Cline*, "a court's task is to make *whole* the damaged property owner":

*Industries which utilize large amounts of underground waters will not be liable unless their use is unreasonable and creates a burden to neighboring landowners. Rural owners are also protected from commercial users who drastically lower the water table.*

*Scientific knowledge in the field of hydrology has advanced in the past decade to the point that water tables and sources are more readily discoverable. This knowledge can establish the cause and effect relationship of the tapping of underground water to the existing water level. Thus, liability*

<sup>114</sup> "Who Owns The Water?", *Water Systems Council*, updated August 2016. <http://nationalaglawcenter.org/wp-content/uploads/2017/03/Who-Owns-the-Water-2016-Update-FINAL.pdf>.

<sup>115</sup> *McNamara et al. v. City of Rittman*, [No. 2004-0357] and *Hensley et al. v. City of Columbus et al.*, [2004-0363], Ohio: Supreme Court 2005. [https://scholar.google.com/scholar\\_case?case=155410187891720970&hl=en&as\\_sdt=2006](https://scholar.google.com/scholar_case?case=155410187891720970&hl=en&as_sdt=2006).

<sup>116</sup> *Cline v. Am. Aggregates Corp.* 15 Ohio App. 3d 384 (Ohio 1984), upheld on appeal, [https://scholar.google.com/scholar\\_case?case=18039931694965782884&q=cline+v+american+aggregates+corporation+1989&hl=en&as\\_sdt=2006](https://scholar.google.com/scholar_case?case=18039931694965782884&q=cline+v+american+aggregates+corporation+1989&hl=en&as_sdt=2006).

*can now be fairly adjudicated with these advances which were sorely lacking when this court decided Frazier more than a century ago.*

As mandated by the OMB, a planning authority cannot disregard the competing interests of the community at the behest of the aggregate industry while addressing and weighing land use policies and options:<sup>117</sup>

*The PPS mandates that that all relevant policies must be considered by the planning authority.<sup>118</sup> The Ontario Municipal Board found in Ontario (Ministry of Natural Resources)...that Part III of the PPS makes it “abundantly clear” that a planning authority must consider all relevant interests, and that all policies must be considered and weighed when land use decisions are to be made [para. 30].<sup>119</sup>*

*The phrase “as is realistically possible” in section 2.5.2.1 of the PPS means that a proposal for aggregate must address competing interests:*

*The “as is realistically possible” approach means addressing competing interests of many stakeholders, one of which is the aggregate industry. With respect, it would be an oversimplification of the policy and an error of interpretation in my estimation to suggest that “as is realistically possible” only includes the physical existence of the aggregate resource.<sup>120</sup> [para. 36]*

*Ontario’s Planning Act, and the PPS and the Official Plan applicable in the unorganized township of Gorham, stress balance and compatibility between land uses. **Contrary to that mandatory direction, the LRPB [Lempiala Sand & Gravel Limited] focused solely on the provisions of the planning documents which support aggregate extraction [section 2.5] and did not consider the provisions which support recreational and residential land use, and environmental protection [para. 3].** [emphasis added]*

Section 1.2.6 of the 2014 Provincial Policy Statement (PPS)<sup>121</sup> sets out the provincial expectation when planning for major facilities such as a quarry in proximity to sensitive or incompatible land uses:

*Major facilities and sensitive land uses should be planned to ensure they are appropriately designed, buffered and/or separated from each other to prevent or mitigate adverse effects from odour, noise and other contaminants, minimize risk to public health and safety, and to ensure the long-term viability of major facilities.*

The PPS takes its definition for “adverse effects” from the Ontario *Environmental Protection Act* (EPA), and includes one or more of the following factors:

- a) *impairment of the quality of the natural environment for any use that can be made of it,*
- b) *injury or damage to property or to plant or animal life,*
- c) *harm or material discomfort to any person,*
- d) *an adverse effect on the health of any person,*
- e) *impairment of the safety of any person,*
- f) *rendering any property or plant or animal life unfit for human use,*
- g) *loss of enjoyment of normal use of property, and*
- h) *interference with the normal conduct of business.*

<sup>117</sup> *Kevin Matthews et al v. Lempiala Sand & Gravel Limited*, File no. PL180754, <https://www.cela.ca/sites/cela.ca/files/TLCA%20Case%20Synopsis.pdf>.

<sup>118</sup> PPS, Part III, policy 4.4.

<sup>119</sup> *Ontario (Ministry of Natural Resources), Re*, 2012 CarswellOnt 10693, at para 25 [*Ontario (MNR)*], in TLCA Book of Authorities, Tab 2, applying Part III of PPS, 2005.

<sup>120</sup> *2220243 ONT Inc., Re*, [2015] OMBD No 418, at para 41, in TLCA Book of Authorities, Tab 4.

<sup>121</sup> <http://www.mah.gov.on.ca/AssetFactory.aspx?did=10463>.

The *PPS* policies flow from the provincial interests articulated in s.2 of the *Act*, including,

- i) “(h) the orderly development of safe and healthy communities” and
- j) “(o) the protection of public health and safety”

The *PPS* must also be read in conjunction with s.14(1) of the *EPA*:

*...a person shall not discharge a contaminant or cause or permit the discharge of a contaminant into the natural environment, if the discharge causes or may cause an adverse effect.*

The *EPA* is to be given a broad and liberal meaning.<sup>122</sup> The *EPA*’s definition of *contaminant* means any **solid, liquid, gas, odour, heat, sound, vibration, radiation** or combination of any of them resulting directly or indirectly from human activities that cause or may cause an *adverse effect*. **Flyrock** is a “solid” and one of a number of potential contaminants associated with quarry blasting.<sup>123</sup>

Any development must also adhere to the **D-1 Land Use and Compatibility** guideline of the Ontario Ministry of the Environment, Conservation and Parks (MOECC).<sup>124</sup> *Section 14(1) of the Environmental Protection Act* is the primary legislative basis for this *guideline*.

### **Synopsis**

*This guideline identifies the direct interest of the Ministry in recommending separation distances and other control measures for land use planning proposals to prevent or minimize adverse effects from the encroachment of incompatible land uses where a facility either exists or is proposed. This guideline sets the context for all existing and new guidelines relating to land use compatibility.*

***The guideline is intended to apply only when a change in land use is proposed, however, compatibility concerns should be recognized and addressed at the earliest possible stage of the land use planning process for which each particular agency has jurisdiction. The intent is to achieve protection from off-site adverse effects, supplementing legislated controls.*** [emphasis added]

*The guideline encourages informed decision-making for Ministry staff, land use planning and approval authorities, and consultants. All land use planning and resource management agencies within the Province shall have regard for the implications of their actions respecting the creation of new, or the aggravation of existing, land use compatibility problems.* [emphasis added] *The Ministry shall not be held liable for municipal planning decisions*

<sup>122</sup> “The *EPA* is Ontario’s principal environmental protection statute. Its status as remedial legislation entitles it to a generous interpretation (*Legislation Act, 2006*, S.O. 2006, c. 21, Sch. F, s. 64; *Ontario v. Canadian Pacific Ltd.*, 1995 CanLII 112 (SCC), [1995] 2 S.C.R. 1031, at para. 84). Moreover, as this Court recognized in *Canadian Pacific*, environmental protection is a complex subject matter — the environment itself and the wide range of activities which might harm it are not easily conducive to precise codification (para. 43). As a result, environmental legislation embraces an expansive approach to ensure that it can adequately respond ‘to a wide variety of environmentally harmful scenarios, including ones which might not have been foreseen by the drafters of the legislation’ (para. 43). Because the legislature is pursuing the objective of environmental protection, its intended reach is wide and deep (para. 84),” *Castonguay Blasting Ltd. v. Ontario (Environment)*, [2013] 3 SCR 323, 2013 SCC 52 (CanLII), <<http://canlii.ca/t/g1038>>, retrieved on 2019-09-29.

<sup>123</sup> In *R. v. Glen Leven Properties Ltd.*, (1977), 15 O.R. (2d) 501, O.J. No. 286, the Divisional Court found that sand which naturally blows in the wind is not a contaminant, but when sand that would normally remain stationary is moved by human activity, such as a blasting operation, it becomes a contaminant. <http://www.beament.com/wp-content/uploads/2016/03/2.-Ontario-Court-of-Appeal-to-Hear-Case-Involving-Flyrock.pdf>.

<sup>124</sup> <https://www.ontario.ca/page/d-1-land-use-and-compatibility#section-0>.

that disregard Ministry policies and guidelines. When there is a contravention of Ministry legislation, Ministry staff shall enforce compliance.

**Nothing in this guideline is intended to alter or modify the definition of 'adverse effect' in the Environmental Protection Act. [emphasis added]**

#### **Irreconcilable Incompatibilities (3.4)**

**When impacts from discharges and other compatibility problems cannot be reasonably mitigated or prevented to the level of a trivial impact (defined in Procedure D-1-3, "Land use Compatibility: Definitions") new development, whether it be a facility or a sensitive land use, shall not be permitted.<sup>125</sup> [emphasis added]**

### ***Unpredictability of Flyrock and Its Consequences***

It has long been known that when planning blasts flyrock remains one of the most erratic and dangerous factors, even when predictive formulae are based on measurements of worst case scenarios:

***In the blasting industry, flyrock causes more deaths, injuries and asset damage than all other causes put together. A surprising statistic? A North American study of 412 lethal and non-lethal accidents in 2001 found that 27.7 per cent of these accidents were caused by wild flyrock outside the clearance zone and 45.6 per cent were due to localised flyrock within the clearance zone. [emphasis added]***

***A final word of caution: these predictive formulae are based on measurements of worst case scenarios of flyrock throw. Flyrock is notoriously inconsistent and a prediction of 200m does not mean that flyrock will travel 200m from every blast. [emphasis added]***

***Worst case occurrences generally happen when a blast hole intersects a fault zone or is collared in broken rock which has been fractured during previous blasting. [emphasis added]***

***It is easy to use an observational approach and keep on incrementally reducing the stemming. This might work for dozens of blasts, and then there will be that one rogue blast hole that proves the formulae correct. It only takes one hole to create enough wild flyrock to create a possibly tragic situation, and at the same time risk the loss of the quarry licence, the shotfirer's licence and the company's insurance policy.<sup>126</sup> [emphasis added]***

Various empirical relationships have been established to predict flyrock resulting from blasting. In calculating flyrock distance, the existing empirical methods only consider a limited number of effective parameters. Other parameters such as blast geometry, geological conditions and human error also affect the measure of flyrock distance. Consequently, the empirical methods are not accurate enough in many cases, even though prediction of the exact values of flyrock distances is crucial to estimate the extent of the blast safety area.<sup>127</sup>

<sup>125</sup> "More details for specific facilities may be identified in other Ministry guidelines listed in Procedure D-1-2, "Land Use Compatibility: Specific Applications".

<sup>126</sup> Article by John Butchart from *Quarry* posted February 1, 2014 <https://www.quarrymagazine.com/Article/3569/Flyrock-prediction-From-mystery-to-science>.

<sup>127</sup> In a controlled study of 113 blasting operations at Putri Wangsa quarry, the most influential parameters on flyrock including hole depth, burden to spacing ratio, stemming length, maximum charge per delay, powder factor, rock density and Schmidt hammer rebound number were considered as input parameters, whereas the flyrock distances were assigned as the output parameter. Actual flyrock distances measured 43.7 meters to 205.5 meters. <https://www.hindawi.com/journals/tswj/2014/643715/#B10>, Table 1.

Most flyrock incidents go unnoticed or unreported, concealing the true extent of the potential adverse impacts of blasting. The percentage of documented flyrock incidents occurring due to flyrock justifies its significance irrespective of the fact that the problem is seldom reported.<sup>128</sup>

### ***Examples of Documented Flyrock Incidents***

A sample of documented cases of flyrock that have caused various *adverse effects*, including personal injury and death, are summarized as follows:

- On September 3, 2019, a blast at the Martin Farm Quarry in Clear Brook, Virginia, scattered flyrock on neighbouring properties. Flyrock was found in four separate locations, but there were no reports of injuries.

<https://www.aggman.com/quarry-blast-sends-fly-rock-into-yards-of-neighboring-homes/>.

- On April 10, 2018, during a standard drill and blast operation at Albury Quarry, northeast of Albury, New South Wales, flyrock flew between 300 and 340 metres from the blast location, striking three light vehicles parked a short distance away from people. Seven people narrowly escaped being injured by flyrock. **The blasting contractor estimated the blast exclusion zone for personnel to be 400 to 500 metres from the blast site** [emphasis added]. The incident was not immediately reported, and did not come to the attention of the NSW Resources Regulator until September 7, 2018.

*“Dangerous incidents must be reported to the NSW Resources Regulator in accordance with section 15 of the Work Health and Safety (Mines and Petroleum Sites) Act 2013 and regulations.”*

<https://www.quarrymagazine.com/Article/9011/Flyrock-incident-in-NSW-quarry>.

- On August 8, 2017, a blast at Jefferson Quarry, Minnesota, sent flyrock as large as 82 pounds (37 kilograms) into a residential neighbourhood. One rock sailed a distance of about 570 feet (174 metres) punching a hole in the siding of a home, another sheared off large tree branches, and a witness described the sound of dozens of rocks flying through treetops and bouncing off roofs. A building struck by one of the larger rocks is city-owned subsidized housing apartment building. The quarry owner had its blasting permit suspended.

*Tim Slipy, a Mankato resident who lives next door to the home that was struck by one of the large flying rocks, told the news agency that the blasts are frequent enough that he gave little thought to the quarry’s warning horn on August 8. “The horn blew. They do three blows before a blast, and about a minute later it goes off,” Slipy said. “This one, they did three blasts and, about five seconds later, there was a blast.” Then he noticed the sound of the rocks flying through the air.*

An investigation of the August 8, 2017 quarry blast disclosed that,

<sup>128</sup> Avtar K. Raina, V.M.S.R. Murthy and Abhay K. Soni, “Flyrock in surface mine blasting: understanding the basics to develop a predictive regime,” *Current Science* (Vol. 108, No. 4, Feb. 2015): 660-665. <https://www.currentscience.ac.in/cs/Volumes/108/04/0660.pdf>.

*In regard to loading and detonating the explosives...everything was pretty routine other than one or two holes that seemed to be leaking explosives, the workers...told Mankato fire and police officials.*

*[W]orkers were pouring 4,124 pounds of ammonium nitrate and fuel oil into 47 holes that had been drilled deep into a shelf of limestone. Known as ANFO, the legal explosive was the same type used by terrorist Timothy McVeigh in 1995's Oklahoma City bombing, and the amount was only about 18 percent less than the 4,800 pounds McVeigh detonated outside the Alfred P. Murrah Federal Building, killing 168 people. This time the ANFO was being used by certified explosives experts with hundreds of blasts on their resumes.<sup>129</sup>*

The same quarry had its blasting permit suspended for 60 days following a prior blast on April 25, 2017 that was immediately followed by an earthquake-like tremor measuring 2.8 on the Richter scale, and strong enough to rattle buildings, prompting more than two dozen property damage reports.<sup>130</sup> U.S. Geological Survey scientists said it's unlikely the tremors occurred naturally.<sup>131</sup> After the August 8, 2017 quarry blast, the quarry's blasting permit was again suspended, and the Department of Public Safety informed Jordan Sands it would not reactivate the permit.<sup>132</sup> Following an investigation into the August 8, 2017 incident, the Attorney's office decided against criminal charges as it would be difficult to prove a "negligent discharge," a charge that can be levelled when someone "negligently causes an explosive or blasting agent to be discharged" in a manner that was in "gross disregard for human life or property."  
<https://www.aggman.com/blasting-permit-suspended-for-mankato-quarry-after-large-rocks-fly-into-neighborhood/>.

- On May 17, 2017, six workers were exposed to the risk of death or serious injury when flyrock from mine blasting landed near the workers, within the mine's **500 metre personal exclusion zone** at the Moolarben Coal Mine near Mudgee. The workers were standing 246 metres from the blast site, and a 20 kg rock landed on a light vehicle. (**One of the workers had suggested to the group that they should report to the mine that the damage to the vehicle was caused by the car hitting a kangaroo while being driven off site.**)<sup>133</sup> The operator and one of its former contract workers were taken to court by the NSW Resources Regulator for alleged contraventions of the *Work Health and Safety Act*. **The alleged offences carry a maximum penalty of \$1.5 million in the case of the operator and \$300,000 in the case of the contract worker.**

- On March 22, 2016, **Tracy L. Hockemeier was killed instantly when he was struck in the head by flyrock, weighing approximately 20 pounds (9 kilograms) and travelling at about 240 mph (386 kph) at the point of impact**, during blasting operations in the Winterset section of Plant 862 in Madison County, Earlham, Iowa. Hockemeier was sitting in a pickup truck, approximately 1,200 feet (366 metres) from the blast site, preventing others from entering the blast area. When the blast was initiated, flyrock was propelled upward, landing on and penetrating the roof of the truck and striking the victim.

*The mine operator failed to ensure that either the operator or the blasting contractor designated a safe distance from the blast site as a “blast area” to be cleared of persons prior to the blast. The mine operator also failed to ensure that either the operator or the blasting contractor adequately assessed and considered several of the factors listed in 30 C.F.R. § 56.2 in determining the boundaries of the “blast area” as that term is used in 30 C.F.R. § 56.6306(e). Those factors included, but were not limited to, the poor geologic conditions of the blast site and the material to be blasted; the loose rock; the voids, cracks and mud seams encountered during the drilling and loading process; the excessive water and mud infiltration into the blast holes, and the loss of loadable drilled holes due to excessive mud and water; powder factors; stemming issues; the operator’s blasting experience; and the effect of these factors on the potential distance of fly rock. Proper and adequate consideration of such factors would have led a reasonable and prudent operator and blaster to determine that the safe boundary of the blast area should have been further away from the blast site than the approximately 1,200 feet [366 metres] that the leadman was positioned from the blast site at the time of the blast.*

<https://www.msha.gov/data-reports/fatality-reports/2016/fatality-3-march-22-2016/final-report>.

- On September 19, 2016, a blast at Gateway Materials quarry sent rocks flying onto an occupied Halifax apartment building more than a kilometer (1000 metres) away. The blast threw rocks over the Bicentennial Highway and struck Parkland Arms apartment building at 390 Parkland Drive.<sup>134</sup> The explosives company pleaded guilty to an Occupational Health and Safety Act charge. In 2005, the same company was fined \$43,500 for a more serious incident that damaged the same building on August 13, 2003. Flyrock ranging in mass from pebbles to 150 kilograms crashed into the same apartment building. One rock smashed through the ceiling of a top-floor apartment, while another bounced off the parking lot and shattered a window on the ground floor. <https://www.thechronicleherald.ca/news/local/blasting-company-fined-40000-after-rocks-hit-apartments-in-2016-halifax-mishap-257818/>.
- On May 21, 2015, a blast at a Loudoun County, Virginia, quarry sent rocks and debris smashing into homes and cars, leaving one person injured. A security camera video shows a rock flying through the air and shattering glass in the nearby Fairfax Auto Parts store, and a half dozen cars damaged in the store’s parking lot. Three large windows at the store were shattered when a rock went through the front of the store. Employees said they are used to the building shaking from nearby quarry blasts, but the size of these rocks was unprecedented. A huge rock from the quarry tore through the roof of a house a half mile (805 metres) away and landed in a bedroom. The person who was sleeping in the room was cut by debris that fell from the ceiling and needed eight stitches.

---

<sup>134</sup> Reportedly, City Centre Property Management filed a lawsuit against Gateway Materials Ltd. and B.D. Stevens Ltd. in the Nova Scotia Supreme Court in September 2018.

<https://www.nbcwashington.com/news/local/Sterling-Quarry-Blast-Sends-Rocks-Into-Cars-Buildings-304624031.html>

- On May 28, 2014, one of Consbec's controlled blasts resulted in flyrock being projected outside the blasting area and onto a neighbouring residential property, approximately twenty-five (25) feet from where the homeowner and an employee of Bruman were standing. Consbec Inc. and Bruman Construction Inc. were fined a total of \$150,000 for failing to notify the *Ministry of the Environment and Climate Change* ("MOECC") of a flyrock discharge from a quarry in North Bay.  
<https://www.siskinds.com/failure-notify-brings-150000-fine-despite-no-damage-property/>.
- On September 3, 2014 Rock Breakers executed a blast at the quarry in Merrick Township that caused errant flyrock to project outside of the blast area and onto a neighboring residential property. Flyrock the size of a basketball among other pieces landed 50 to 75 meters from the front door of the residence. Rock Breakers failed to report the flyrock discharge. Rock Breakers (2007) Inc. pleaded guilty to two offences for discharging or permitting the discharge of flyrock into the natural environment, which may have caused an adverse effect, and for failing to report the discharge, contrary to the *Environmental Protection Act*. Rock Breakers (2007) Inc. was fined a total of \$60,000 plus a victim fine surcharge of \$15,000.  
<https://news.ontario.ca/ene/en/2015/11/drilling-and-blasting-contractor-fined-60000-for-fly-rock-discharge-and-failing-to-report-incident.html>
- On July 19, 2013, an explosion at a quarry in Nepal hurled rocks and debris around a kilometer radius. Flyrock struck and killed one person in a factory 500 metres away, and eleven others were injured in the hail of rocks, and 14 other factories were damaged. Twenty cars were crushed by flying boulders. A total of 37 department personnel from the local fire departments were dispatched to the scene.  
<https://www.thestar.com.my/news/nation/2013/07/20/one-killed-in-quarry-site-explosion>
- On September 20, 2011, blasting at a Vancouver Island (Shawnigan Lake) gravel quarry hurled baseball-sized, jagged rocks 400 to 500 meters, striking three people. One woman had her arm severed below the elbow, and two men were seriously injured. Boulders rained onto nearby truck yards, with one rock breaking a piece of one-inch plywood on a flatdeck truck in the driveway.<sup>135</sup> **(The B.C. government released a practical guidebook to help promote safety in aggregate mining operations in January 2008, after four workers were killed in separate incidents in B.C.'s quarries in 2007.)**  
<https://canada.constructconnect.com/joc/news/projects/2011/09/investigation-launched-after-explosion-at-vancouver-island-gravel-quarry-injures-three-workers-joc046827w>.
- On February 24, 2011, a blast at Brayford Quarry sent flyrock 200 metres onto public roads and damaged waiting cars, and narrowly struck a workmen who had halted traffic while the blasting took place. The two cars waiting in the queue on a nearby public road were hit by flyrock, which dented the bonnet of one and shattered the

<sup>135</sup> <https://bc.ctvnews.ca/gravel-pit-blast-severs-woman-s-arm-injures-2-1.700846>.

windscreen of the other. HSE inspectors discovered an 8.5 kilogram rock on the other side of the road, and six smaller pieces of flyrock were recovered from the road. Both the blaster and the quarry owner pleaded guilty in Barnstaple Magistrates' Court and were fined. After the hearing,

*HSE Inspector of Quarries, Mike Tetley, said: 'This was a very serious incident that could easily have led to death or serious injury. 'Blasting operations at quarries are inherently high risk, and these risks must be rigorously controlled by good explosives engineering practice and in accordance with legal requirements.*

<https://www.agg-net.com/news/firms-fined-for-quarry-blast-damage>.

- On May 12, 2010, the discharge of flyrock caused damage to a garage in Magnetawan, Ontario. Castonguay had been hired to do blasting at a nearby quarry located on Old Hwy Road West.

*The Ontario Court of Justice...added a couple of expensive [sic] postscripts to a landmark legal case that confirmed the incident reporting requirements under section 15(1) of Ontario's Environmental Protection Act. Castonguay Blasting Ltd. was found guilty (yet again) of failing to report the discharge of a "contaminant" (fly rock from its blasting operations) that caused or is likely to cause an "adverse effect" (damage to a movie theatre, parked cars and a garage) in three separate incidents.*<sup>136</sup>

The Parry Sound Court fined Castonguay \$75,000 (plus a victim fine surcharge of \$18,750) for failing to notify the MOE about the discharge of fly rock.

<https://news.ontario.ca/ene/en/2014/03/dnx-castonguay-inc-fined-75000-for-failing-to-report-discharge-of-fly-rock.html>

- On July 20 and 23, 2009 during blasting flyrock was discharged beyond the control area of 200 metres at a limestone quarry near Arnprior, Ontario. In the first incident, a small rock struck a worker at a neighbouring business on the arm. In the second incident, rocks were observed flying well beyond the control area. A scale house located 230 metres from the blast was struck by a number of rocks. Two vehicles held at a controlled stop along nearby Young Road on the edge of the quarry property located about 300 metres from the blast were also struck by rock resulting in extensive damage. The blast damaged property and impaired the safety of people. **"It was also determined that the control zone should have been 500 metres for blasting of this nature at the quarry."** [emphasis added] Perth-Austin Powder Ltd. was fined \$130,000 plus 25% Victim Fine Surcharge after pleading guilty to discharging flyrock into the natural environment causing off-site impacts and failing to report the discharges, contrary to the *Environmental Protection Act*.  
<https://news.ontario.ca/ene/en/2014/04/burlington-firm-fined-130000-for-arnprior-blasting-offences.html>
- On September 24, 2008, flyrock from a quarry blast detonated by Maine Drilling and Blasting in South Burlington, Vermont, was thrown several hundred yards and did over a million dollars in damage to vehicles, buildings and airplanes at the Burlington International Airport (para. 44).<sup>137</sup> The same company had a blast go awry in Raymond,

<sup>136</sup> Marc McAree, "Castonguay Convicted Again: Ontario Courts Continue To Recognize Section 15(1) EPA 'Duty to Report,'" [https://www.willmsshier.com/docs/default-source/articles/castonguay-convicted-again.pdf?utm\\_source=Mondaq&utm\\_medium=syndication&utm\\_campaign=View-Original](https://www.willmsshier.com/docs/default-source/articles/castonguay-convicted-again.pdf?utm_source=Mondaq&utm_medium=syndication&utm_campaign=View-Original).

<sup>137</sup> [http://www.killthealbionquarry.org/flyrock\\_danger.pdf](http://www.killthealbionquarry.org/flyrock_danger.pdf).

NH, on April 25, 2005, with flyrock doing damage to buildings and vehicles over 1,000 feet (305 metres) away.

<https://www.valleyreporter.com/index.php/news/my-view/4368->

- On May 6, 2008, flyrock ranging from small pebbles to 22 kilogram (49 pound) boulders rained down on a trailer park in Whitehorse, Yukon Territory (Canadian Press, 2010). The rocks were launched up to 140 metres from the blast site and destroyed a shed, crashed into living rooms of occupied trailers (as seen in Figure 8), and sent one tenant running for his life (Davidson, 2010).<sup>138</sup> At trial, the judge concluded that the blaster acted irresponsibly, while noting that blasting is “inherently dangerous”:
 

*“It wasn't until ‘well after’ the May 6 blast that Hildebrand [the blaster] ever saw a map showing the distance between the boulevard extension and the homes. ‘I have no hesitation in finding that both Sidhu Trucking and Mr. Cratty failed in their duty because they did not ensure that Mr. Hildebrand was properly oriented to the site so as to be aware of the close proximity of persons or property likely to be affected by the blasting operations,’ Faulkner [the judge] wrote. ‘Moreover, **blasting is an inherently dangerous undertaking**, [emphasis added] and it would be common sense to be well aware of the distance to persons or structures -- especially in an urban area” (Canadian Press, 2010).*
- On April 22, 2008, flyrock from a blast at Percy Quarry, Morristown, Vermont, consisting of rocks four to eleven inches long, struck “neighboring houses and the Morristown Highway Garage [686 feet or 209 metres].” “Smaller pieces of flyrock impacted neighboring homes [Pine Crest mobile home park] with so much force the flyrock was found embedded in a metal post and a lawn landscaping rock.” The Morristown garage is located about 686 feet from the blast site, and in a different direction than the mobile home park (718 feet or 219 metres). A subsequent incident at the Percy Quarry on September 9, 2008 again saw flyrock thrown into Pine Crest mobile home park.
- On August 22, 2007, blasting at Miller Braeside quarry in the Township of McNab/Braeside hurled flyrock that structurally damaged the foundation of one home and another home (in another direction) took the brunt of the flyrock. Flyrock struck the Jameses’ residence and vehicle, reportedly, causing \$250,000 in damages.<sup>139</sup> Subsequently, the Jameses filed an action against the quarry owner and the blasting company claiming damages of \$250,000. A prior blasting incident in September 2005, labeled the “megablast,” caused damage to residences, driveways and wells. Reportedly, some neighbours received compensation but only if they signed a confidentiality agreement, and to never come after Miller again for any damages. “One neighbor, Mr. Battiston, described flyrock that landed on his roof over 400 metres from the site.”<sup>140</sup> The vibrations in the bedrock from the blast caused one of two wells of a neighbouring farmer to go dry, and a new well had to be dug, for which, reportedly, no compensation was received. The water from the other well was so murky that water for his cattle had to be hauled from the Ottawa River for a number of days. After the second flyrock incidence, the MOE charged the company and issued a \$25,000 fine.

<https://www.insideottawavalley.com/news-story/4508046-company-guilty-of-pakenham-blasting-mishap/>.

- On June 11, 2007, in West Lebanon, NH, Green Mountain Explosives detonated a quarry blast that resulted in flyrock being thrown 3,000 feet (10 football fields) into an industrial park doing damage to a building and 11 vehicles in the Technica USA parking. This same blast also sent flyrock about 4,000 feet (1,219 m) in another direction that landed on a runway of West Lebanon Airport, spreading dirt and debris. Tim Rath, manager of Technical Services of Green Mountain Explosives, represented Rivers as their blasting expert in environmental court.<sup>141</sup> On May 2, 2016,

Rath testified at an environmental hearing<sup>142</sup> **that during a blasting event the nearby residents near [proposed] Rivers' Quarry [93 acres] should be in their homes and not out on their property. When asked specifically about the danger from flyrock, Mr. Rath said that,**

*"You can never say never." No matter how careful a blaster is there is no certainty a blast will not cause flyrock. There are over 20 homes within 3,000 feet [914 metres] of the proposed quarry with the closest property lines just over 200 feet [61 metres] away. [emphasis added]*

<http://www.killthealbionquarry.org/DEATH-FROM-THE-SKY-FLYROCK.html>.

- On May 4, 2007, a blast set off at the Pattersonville Plant #61, a surface crushed stone operation, resulted in flyrock travelling approximately 526 feet (160 metres) onto New York State Thruway I-90, striking three vehicles and resulting in two injuries. A charter bus traveling west was struck by a rock weighing about 100 pounds (45.4 kilograms) that penetrated the roof and injured a teenager. The driver of a vehicle travelling east was struck in the abdomen after rock shattered the windshield. A third vehicle struck by flyrock received a broken windshield and dents to the hood.  
<https://fmshrc.gov/decisions/alj/Yk2007-74o.htm>.
- On January 10, 2006, a blast at the quarry of Denis Tarrant & Sons Limited, Kilfeacle, Co. Tipperary, Ireland, hurled flyrock over 300 metres and caused widespread damage to quarry plant, private cars and buildings within the quarry complex. Three people were also injured.  
[https://www.hsa.ie/eng/Topics/Inspections/Prosecutions/Prosecutions\\_2009/](https://www.hsa.ie/eng/Topics/Inspections/Prosecutions/Prosecutions_2009/).

In rejecting the proposed Rivers' Quarry, the environmental court concluded that,

*Blasting at the proposed quarry would have several materially adverse impacts upon the surrounding properties and uses, including substantial risks to the neighbors' water supply from*

---

<sup>141</sup> In a 71-page decision, the Vermont Environmental Court concluded "that the proposed Rivers quarry would not 'fit' into its surrounding area, which has been designated and is actively used as a scenic resource, and will therefore bring an undue adverse impact upon this area. The proposed quarry does not conform to criterion 8. The noises and activity that the proposed quarry will bring to this area will be unique; they are not currently experienced in any fashion within the Ag-Res District and along the scenic corridor that is Route 100B." The court concluded that "Rivers quarry, as proposed, is in conflict with...the use and enjoyment of neighboring properties."

<https://www.vermontjudiciary.org/sites/default/files/documents/Rivers%20Development%20LLC-1.pdf>.

<sup>142</sup> State of Vermont "Act 250 hearing" is conducted by a three-member District Environmental Commission. Their responsibility is to consider evidence presented by legally designated parties and to evaluate each Act 250 application in accordance with the 10 Criteria."  
[https://nrb.vermont.gov/sites/nrb/files/documents/Act%20250%20Hearing%20Information\\_0.pdf](https://nrb.vermont.gov/sites/nrb/files/documents/Act%20250%20Hearing%20Information_0.pdf).

*toxic chemical spills and altered groundwater flow patterns, air quality impacts from dust, and aesthetic impacts including noise over 70 dBA beyond the Rivers' property line...and the hazard that flyrock poses to neighboring properties and uses.*

- In December 2005, the NSW Department of Primary Industries issued a Safety Alert following a flyrock incident at a quarry. During a quarry blast, flyrock was projected more than 500 metres onto the Pacific Highway. A rock of approximately 100mm diameter was also projected onto a nearby property where it caused damage to a shed and parked vehicle. In addition, the windscreen of a front end loader in the quarry was broken. The drilling and blasting was carried out some 36 metres below the top level of the pit.  
[https://www.resourcesandgeoscience.nsw.gov.au/\\_data/assets/pdf\\_file/0010/66376/Safety-Alert-05-16-Blast-Control-Flyrock-incident.pdf](https://www.resourcesandgeoscience.nsw.gov.au/_data/assets/pdf_file/0010/66376/Safety-Alert-05-16-Blast-Control-Flyrock-incident.pdf).
- According to a “Flyrock Hazard Alert” issued by the Virginia Department of Mines Minerals and Energy, **“flyrock can travel 3,000 feet [914 m] or more, reach speeds of 400 miles per hour, and can penetrate buildings, smash vehicles, and cause great bodily harm.”** “From December 2003 through August 2006, five serious flyrock incidents have occurred from blasting at surface mineral mines/quarries in Virginia.”  
<https://www.dmme.virginia.gov/dmm/PDF/SAFETY/ALERTS/blastingflyrock/FlyrockHazardAlert.pdf>.
- In 1991, a granite quarry in Virginia set off a blast that generated flyrock causing major damage to two homes, a garage, boat, basketball goal, along with other damage. The impacted neighbourhood was approximately 2,000 feet (610 metres) from the location of the blast, and people were close-by. A rock weighing about 17 pounds had gone through the wall of one house causing considerable damage to the wall and furniture inside. The second residence had a rock go through the outer brick wall and lodge in the inside wall. The picture window was broken, an inside wall, and the bookcase sitting against it were damaged, with litter around the room from the bookcase. Another rock had gone through the garage and exited through the opposite end of the building, causing considerable damage. Those responsible for investigating the flyrock incident were of the opinion that there was a weakness in the burden between the face and shot holes (p. A6-7).  
<https://www.dmme.virginia.gov/DMM/pdf/TRAINING/SBGuide.pdf>.
- On July 11, 1990, flyrock from a Livingston County, IL limestone quarry blast traveled about 930 feet (283 metres) and struck a resident who was mowing grass on his property. **He died from head injuries on July 17, 1990.** [Mine Safety and Health Administration, Department of Labor 1990B]  
<https://www.cdc.gov/niosh/mining/UserFiles/works/pdfs/sofad.pdf>.
- On November 3, 1989, a limestone quarry in Virginia set off a blast that generated flyrock and excessive airblast. Twenty-three homes were damaged. Three of the homes suffered structural damage from flyrock, and two homes had their windows broken. The airblast was in excess of 145 decibels. An investigation concluded that “the weakness/cavities in the geological structure of the formation/rock to be shot and the failure to recognize this potential led to this incident occurring [p. A8].”  
<https://www.dmme.virginia.gov/DMM/pdf/TRAINING/SBGuide.pdf>.

## **BLASTING IS AN ULTRAHAZARDOUS OR ABNORMALLY DANGEROUS ACTIVITY**

Blasting has been identified as “intrinsically dangerous,” because of the impossibility of “predicting with certainty the extent or severity of resulting consequences” rendering blasting ultrahazardous.<sup>143</sup> Ultrahazardous activities are also known as “abnormally dangerous” activities. No amount of reasonable care can “eliminate the risk of serious harm” accompanying an ultrahazardous activity such as blasting.<sup>144</sup> Accordingly, courts have held that a rule of strict liability applies to actionable harms resulting from blasting.

*Because these activities [blasting] are extremely dangerous, they must “pay their own way, [citation omitted] and the parties responsible must bear the cost regardless of whether they have been negligent. North Carolina courts have not yet recognized as ultrahazardous any activities other than blasting [para. 234].<sup>145</sup>*

Strict liability does not require proof of negligence:<sup>146</sup>

*Strict liability is a legal doctrine that holds a party responsible for their actions or products, without the plaintiff having to prove negligence or fault. When someone partakes in ultrahazardous activities such as keeping wild animals, using explosives, or making defective products, then they may be held liable if someone else is injured.*

*Even if the defendant took necessary precautions and followed safety requirements, strict liability crimes are unique in that they would still hold the defendant responsible. Due to the nature of the activity, the defendant should be able to foresee that a person could be harmed by it.*

### **Case Study 1**

In *Dyer*,<sup>147</sup> the appellate court noted that blasting is “inherently dangerous” and that “most courts have recognized that this inherent danger cannot be eliminated by the exercise of care.” The courts have allowed strict liability in blasting cases because of the unpredictability of the danger associated with even the most cautious blasting. (Worley, 210 S.E.2d at 163) In support of this assertion, the court demonstrated that “Dyers’ expert testified that blasting may cause damage even when it is within the [United States Bureau of Mines] guidelines.”

*The court further justified imposing strict liability by contending that “although blasting is a lawful and often beneficial activity, the costs should fall on those who benefit from the blasting, rather than on an unfortunate neighbor.”*

<sup>147</sup> *Dyer v. Maine Drilling and Blasting, Inc.*, 63 Me. Rev. 331 (2010). See “The Wrong Approach at the Wrong Time?”: Maine Adopts Strict Liability for Abnormally Dangerous Activities

In order to prevail on an ultrahazardous or abnormally dangerous claim, the plaintiff needs to prove all of the following elements:<sup>148</sup>

- *The activity involves a verifiable risk of serious harm to persons or property*
- *The activity cannot be performed without the risk of serious harm, no matter how much care is taken, and*
- *The activity is not commonly engaged in by the people of the community*

*Also, it must be proven that the defendant's actions actually caused the plaintiffs' injuries, and that the plaintiff did in fact sustain injury.*

## **Case Study 2**

Prior to the 1969 ruling in *Spano v. Perini Corp.*, for a person in the State of New York to succeed on a claim for damages caused by blasting there had to be a showing of negligence on the part of the blaster, unless the blast was accompanied by an actual physical invasion of the damaged property. For example, a physical invasion by rocks or other materials cast upon premises from a nearby blast. *Spano*, one of the plaintiffs, owned a garage which he alleged was wrecked ("cracked in the wall...the window broke, and the cement floor all pop up") by concussion from a blast on November 27, 1962, consisting of 194 sticks of dynamite, occurring at a construction site 125 feet from the damaged premises. Davis, the second plaintiff, whose car was in the garage for repair at the time of the blast, claimed that the blast had damaged his car. At the bench trial, although the plaintiffs did not pursue a claim of negligence, judgments were rendered in their favour, with the court awarding *Spano* \$4,400 and Davis \$329. On appeal, a divided Appellate Term reversed the judgment, declaring that it was bound by the established rule in *Booth*<sup>149</sup> requiring proof of negligence. The dissent urged that the *Booth* case of 1893 should no longer be considered controlling precedent. The Appellate Term reversal was affirmed by the Appellate Division. The Appellate Division called attention to a decision of the Third Department ([Thomas v. Hendrickson Bros., 30 A D 2d 730, 731](#)), in which the court observed that "[i]f *Booth* is to be overruled, the announcement thereof should come from the authoritative source and not in the form of interpretation or prediction by an intermediate appellate court":

*In our view, the time has come for this court to make that "announcement" and declare that one who engages in blasting must assume responsibility, and be liable without fault, for any injury he causes to neighboring property.*

On the issue of strict liability, the Appellate Division went on to acknowledge that,

*The concept of absolute liability in blasting cases is hardly a novel one. The overwhelming majority of American jurisdictions have adopted such a rule. (See Prosser, Torts [2d ed.], § 59, p. 336; 3 Restatement, Torts, §§ 519, 520, comment e; Ann., 20 ALR 2d 1372.)<sup>150</sup>*

<sup>148</sup> LegalMatch, <https://www.legalmatch.com/law-library/article/ultrahazardous-activity-liability.html>. See *Restatement (Third) of Torts* § 20(b) (2009). A person who is found by a court to have carried on an abnormally dangerous activity will be subject to **strict liability** for physical harm resulting from that activity.

<sup>149</sup> *Booth v. Rome, W. & O.T.R.T. Co.* 140 N.Y. 267 (1983) 35 N.E. 592.

<sup>150</sup> See, e.g., [Exner v. Sherman Power Constr. Co., 54 F.2d 510 \(2d Cir.\)](#); [Colton v. Onderdonk, 69 Cal. 155](#); [Whitman Hotel Corp. v. Elliot & Watrous Eng. Co., 137 Conn. 562](#); [FitzSimons & Connell Co. v. Braun, 199 Ill. 390](#); [Louden v. City of Cincinnati, 90 Ohio St. 144](#); [Hickey v. McCabe & Bihler, 30 R. I. 346](#).

### **Case Study 3**

Offences under the *Occupational Health and Safety Act*, R.S.Y., 2002, c. 159, are strict liability. On November 1, 2007, an explosive charge set off by P.S. Sidhu Trucking Ltd.<sup>151</sup> on the Hamilton Boulevard Extension in the City of Whitehorse sent a piece of flyrock, the size of the owner's fist, through the roof of Trailer #23 and landed on the living room floor. Trailer #23 is located in Lobird Trailer Court approximately 350 metres from the blast site (para. 7). Again on May 6, 2008, a blast scattered flyrock along the road leading to the trailers in nearby Lobird Trailer Court. One rock flew 166 metres from the blast site and penetrated the roof of Trailer #212 and ended up in the living room, nearly hitting the occupants. Trailer #112 and Trailer #218, 219 metres and 149 metres, respectively, from the blast site were also damaged. None of the occupants had been notified of the blast. Other flyrock hit roads, fences, sheds, vehicles and trailers. At trial court, the expert testified that, but for the flyrock incident, the blast was a 98% success (para. 50)!

***An expert blaster called by counsel for the Director of Occupational Health and Safety indicated that blasting is not an exact science, and he appeared unwilling to blame the blaster. Had it not been for the flyrock incident, he testified that he would have considered the blast a success (para. 23). [The expert] did acknowledge that there was zero tolerance for flyrock in urban settings (para. 24) [but said] he might have made the same decisions as the blaster (para. 25). [emphasis added]***

The lower court ruled that the OHS Act is to promote safe practices in the workplace, protecting employees, and members of the public that are in proximity to the workplace. The damage from the blasting incident was foreseeable. Both the blaster and the expert acknowledged that blasting is inherently dangerous. The court's ruling, upheld on appeal, concluded that Sidhu Trucking did not exercise due diligence and failed as an employer to ensure that blasting processes under its control were safe and without risks to health (para. 75).

Richard Scott Parker, testifying in the trial court as an explosives expert with 40 years' experience, was quoted in a March 31, 2010 article,<sup>152</sup> stating that,

*No one can do a perfect blast every time. That's why blasting companies carry insurance.*

### **Case Study 4**

As a result of blasting operations at the Vigus Quarry, the plaintiffs in *Donnell v. Vigus Quarries*<sup>153</sup> were awarded \$27,000 for damages caused to their property by *concussion* and *vibration*. In 1966, the plaintiff commenced construction of a barn. At that time there was no blasting at the quarry adjoining their property. In 1967, the Donnells noticed some blasting at the quarry. Concerned over the effect blasting might have on a home that the Donnells were planning to construct, a representative of the quarry was contacted. The

<sup>151</sup> *Director of Occupational Health and Safety v. Government of Yukon, William R. Cratty and P.S. Sidhu Trucking Ltd.*, 2012 YKSC 47 (CanLII), <<http://canlii.ca/t/fs6vt>>, retrieved on 2019-09-28.

<sup>152</sup> "Blasting is not an exact science': expert," *Whitehorse Daily Star*, <https://www.whitehorsestar.com/News/blasting-is-not-an-exact-science-expert>.

<sup>153</sup> *Donnell v. Vigus Quarries, Inc.*, 526 S.W.2d 314 (1975). [https://scholar.google.com/scholar\\_case?case=11912900217179761342&q=Donnell+v.+Vigus+Quarries+Inc&hl=en&as\\_sdt=2006](https://scholar.google.com/scholar_case?case=11912900217179761342&q=Donnell+v.+Vigus+Quarries+Inc&hl=en&as_sdt=2006).

quarry representative assured the Donnells that there would be no blast damage to structures on their property, which was about a quarter mile from the quarry. Construction of the home was completed in 1969, and the Donnells moved in the same year. In addition to the barn and house, they built a workshop and a pavilion. In late 1969 or 1970 after experiencing vibrations from blasting, the Donnells observed that the front and rear porches had cracked. On further inspection of the home, and other structures on the property, additional cracks were found in the house, barn, pavilion and workshop. Most of the cracks appeared in the fireplaces, the ceilings, basement and floors of the new buildings.

Joseph Brooks, a consulting engineer with a masters degree in civil engineering, was retained by the Donnells. He testified that the home was above average in construction, and that the other buildings on the property were of typical construction. The home is on a rise and the home and other structures are built on hard clay with no fill. Accordingly, drainage settlements and differential settlement were ruled out as causes of the cracking and damages to the structures. Brooks inspected the property in April 1972 and again in February 1973. In response to a hypothetical question, Brooks testified that the damage to the plaintiffs' property was caused by blasting operations. While acknowledging that blasting may be lawfully pursued, the court held that when explosives are intentionally detonated there is absolute liability for injuries and damages.

*Preliminarily we note that blasting is a work which may be lawfully pursued. However, when one intentionally detonates explosives he is absolutely liable for injuries and damages which are the proximate result of such explosions. Summers v. Tavern Rock Sand Company, 315 S.W.2d 201 (Mo. 1958).*

The court was sensitive to the fact that "in cases such as this *vibrations* and *concussions* cannot be seen, and the case must, to a large extent be based on circumstantial evidence [citation omitted]." Damages to property in cases of explosion are measured as the difference in market value *before* and *after* the blasting operation or the cost of restoring the property, whichever is the lesser. A local real estate broker testified on behalf of the Donnells, without objection, that prior to the blast damage the value of the property was \$90,000, and because of the blasting the value of the property had decreased by \$35,000. The trial court awarded \$27,000 in damages, which was upheld by the appeals court.

### **Case Study 5**

In *Cass Company-Contractors v. Colton*,<sup>154</sup> plaintiffs representing 12 separate claims filed suit against the owner of the quarry for damages to their respective houses allegedly caused by the wrongful and negligent discharge of large quantities of high explosives during 1951 and 1952, and in particular an explosion on October 6, 1951, from the quarry located one-half mile away. In a case of first impression, the question of damages resulting from blasting vibrations or concussions had not been addressed by the appeals court in Colorado. On this issue, the appeals court canvassed the rulings of other jurisdictions, and came to the conclusion that absolute liability appears to be the majority rule.

---

<sup>154</sup> *Cass Company-Contractors v. Colton*, 279 P.2d 415, 130 Colo. 593 – Colo. Supreme Court, 1955.

*Authorities from other jurisdictions are divided, some courts resting their opinions on the theory that to be liable for damages from blasting the operator must be shown to have been negligent; others that there must be shown facts and circumstances of the blasting from which negligence may be presumed, or which bring the case under the doctrine of res ipsa loquitur; others that the blasting operation must be shown to constitute a nuisance; and still others, that blasting is an inherently, dangerous operation in which the operator engages at his peril, making him an insurer liable for direct, as well as consequential, injuries therefrom. Whitman Hotel Corp. v. Elliott & Watrous Engineering Co., 137 Conn. 562, 79 A.2d 591, 594-595; Brown v. L. S. Lunder Const. Co., 240 Wis. 122, 2 N.W.2d 859; Pope v. Edward M. Rude Carrier Corp., W.Va., 75 S.E.2d 584, 594-595. This last theory of absolute liability appears to be the majority rule.*

The Colorado appeals court also cited an 1887 Colorado case that involved blasting and damage from falling rock, which it considered relevant:

*"In general, if a voluntary act, lawful in itself, may naturally result in the injury of another, or the violation of his legal rights, the actor must at his peril see to it that such injury or such violation do[es] not follow, or he must expect to respond in damages therefor; and this is true, regardless of the motive or the degree of care with which the act is performed ...[citing cases]. The company was bound at its peril to see that plaintiff's rights of property were not injuriously affected. In so far as these rights were interfered with by defendants' acts, such acts were wrongful; and, if the injuries complained of were the natural and proximate consequence thereof, plaintiff was entitled to recover." [G. B. & L. Ry. Co. v. Eagles, 1887, 9 Colo. 544, 13 P. 696, 697]*

The Colorado appeals court accepted the lower court's finding on the theory that blasting is an inherently dangerous operation, rendering the quarry operator absolutely liable for the damages to the plaintiffs' houses, and also on the theory that the quarry operator was negligent in the blasting, of which the plaintiffs complained. In upholding the lower court's ruling on these two claims, and finding that the quarry blasting and the quarry operator's negligence were the proximate cause of the damage to the plaintiffs' houses, the appeals court alluded to the following evidence:

*There is evidence in the record that the blastings were inherently dangerous operations, and that injuries to nearby houses became apparent immediately thereafter. In such case, whether or not the blastings were the proximate cause of the injuries complained of may be determined...from the facts and circumstances of the case. Velotta v. Yampa Valley Coal Co., 63 Colo. 489, 167 P. 971, L.R.A.1918B, 917. The facts and circumstances in the record in the instant case are sufficient to sustain the findings that the blastings were the proximate cause of the injuries and damages sustained.*

*On the question of negligence there is also evidence in the record sufficient to sustain the findings that defendant operator was guilty of negligence in failing to seek an appraisal of and foresee the natural consequences which might result from its blasting operations, especially in view of the prior remonstrances [plaintiffs' protests] and warnings of possible damages from the nearby house owners to officers of the defendant operator at a public meeting.*

## **Case Study 6**

In *Laughon Johnson v. Burch*,<sup>155</sup> the plaintiffs sustained property damage from nearby blasting in connection with road work. Severe *vibration* and *concussion* from the blasting caused cracks to the exterior and interior of the plaintiffs' residences. At trial,

---

<sup>155</sup> *Laughon Johnson v. Burch*, 278 S.E.2d 856 (1981).  
[https://scholar.google.com/scholar\\_case?case=3814718433162417000&hl=en&as\\_sdt=2006](https://scholar.google.com/scholar_case?case=3814718433162417000&hl=en&as_sdt=2006).

*plaintiffs conceded they had no evidence that defendant was negligent in either case. The plaintiffs' evidence showed that cracks developed in the interior and exterior of their homes following severe vibration and concussion associated with the blasting.*

The trial court ruled in favour of the plaintiffs applying the rule of strict liability, finding as a fact that the *concussion* from the defendant's blasting operation proximately caused the damages. On appeal, the Supreme Court of Virginia upheld the lower court's ruling. The court concluded that "when property is damaged by vibration or concussion from blasting operations, there will be liability upon the blaster irrespective of negligence, provided, of course, the damage claimed is a direct and proximate result of the explosion," quoting favourably from *Exner*:

*It is true that some courts have distinguished between liability for a common-law trespass, occasioned by blasting, which projects rocks or debris upon the property or the person of the plaintiff, and liability for so-called consequential damages arising from concussion, and have denied liability for the latter where the blasting itself was conducted at a lawful time and place and with due care. [Citations omitted.] Yet in every practical sense there can be no difference between a blasting which projects rocks in such a way as to injure persons or property and a blasting which, by creating a sudden vacuum, shatters buildings or knocks down people. In each case, a force is applied by means of an element likely to do serious damage if it explodes. The distinction is based on historical differences between the actions of trespass and case and, in our opinion, is without logical basis. [54 F.2d at 513-14].*

### **Case Study 7**

In *Peet v. Dolese & Shepard Co.*,<sup>156</sup> the plaintiffs claimed for damages caused to their residence by blasting operations at the defendant's stone quarry. According to Chester Peet,

*at approximately 4:00 or 4:30 p.m., on March 8, 1957, he was home; about 5:00 p.m. there was set off a blast at the stone quarry to loosen stone. It was noticeable and quite heavy. Plaster cracked. Dishes fell out of a cupboard....[H]e went to the basement where he noticed a vertical crack on the east wall. On the west wall there was a half inch opening. There were plaster cracks in the living room, and in the bedroom. He heard other blasting from 1957 to 1959; in March, 1958 there was heavy damage; on April 12, 1959, a large stone from a blast landed in his yard, hit his truck, and fine gravel hit the roof of his house; on March 19, 1958, more plaster was cracked in the kitchen and around the chimney from the basement to the top of the house; the cracks allegedly caused by the blasting of March 8, 1957 were not in the house prior to that time. The blast vibration shook the house, plaster chipped, there were finger sized cracks. His house is 800-1000 feet east of the quarry. The blast came in a northerly or westerly direction from the quarry. He stated that prior to March, 1957 he never had occasion to go down and examine the basement for cracks, there were no cracks in the basement from 1947 to 1957, and that he noticed immediately after the blast of March 8, 1957 the vertical crack in his basement wall. There were certain photographs of the basement walls in evidence. The rock that hit his truck in April, 1959 was in evidence....The basement walls were eight inch concrete blocks.*

A separate claim for damages to the defendant's truck caused by flyrock hurled a distance of 800-1,000 feet following blasting on April 12, 1959 at the quarry was settled privately. Levon Seron, an architect, engineer, graduate of Massachusetts Institute of Technology, and a real estate broker, testified on behalf of the plaintiffs as to the condition of the residence.

---

<sup>156</sup> *Peet v. Dolese & Shepard Co.*, 190 NE 2d 613: Appellate Court, 2nd Dist., 2nd Div. 1963. [https://scholar.google.ca/scholar\\_case?case=317413239160314415&q=Peet+v.+Dolese+%26+Sheppard+Co.&hl=en&as\\_sdt=2006&as\\_vis=1](https://scholar.google.ca/scholar_case?case=317413239160314415&q=Peet+v.+Dolese+%26+Sheppard+Co.&hl=en&as_sdt=2006&as_vis=1).

[Seron] viewed the premises in November, 1961 and examined the cracks and the general area of the home. He found the first floor plaster cracks, basement exterior walls cracks in the concrete block foundation on the interior and exterior, and cracks over the front door which were not straight but irregular. He described other cracks in the bedrooms, kitchen, etc. He said if blasting had occurred in close proximity such could cause certain of the cracks. The [trial] Court asked Seron the following questions:

"Assuming that the blasting from Dolese and Shepard Company caused the damage in this house, would there be some force extended through the air or through the ground, or both, or from some other force, or what?"

and the witness answered:

"I would say through the air and ground, it could be both. I would qualify my answer, and I don't know the size of the blast, what it was at the time, but if there was an overcharge of an enormous amount of dynamite, it could or can react in the air as well as the ground."

[Seron] said if an explosive charge was properly placed and tested there could be or would be no damage.

Tim Lewellen, testifying on behalf of the defendant, described in detail the blasting protocols at the quarry, and despite taking every precaution, it was conceded that the use of dynamite is "tricky" and that there is no way to overcome human error.

*Tim Lewellen...testified that the defendant used explosives on March 8, 1957; he determined the depth of the hole; the Atlas Powder Company loaded the shot under his direction; he did not personally load it; he observed the loading. On that date explosives were used at what is commonly called the south wall; this was 800-1000 feet from the plaintiffs' house; the total amount of dynamite used was 3,295 pounds in several holes, some at the depth of 76' and some at the depth of 81'. There was blasting May 6, May 12, May 29, 366\*366 1958, — at 81 foot depths, — 2683 pounds of explosives on one occasion, — 3500 pounds on another, — 3166 pounds on another occasion. Those were 800-900 feet from the plaintiffs' residence. The explosives were gelatin and ammonium nitrate with nitroglycerin. He said some explosions bring down more rock than anticipated, but shock from an explosion would not do that. **When the piece of rock was blown over to the plaintiffs' lot that was from a little blast, it was not in their plan to send it 800 feet, and they had taken every precaution. He said dynamite is T.N.T., the expression dynamite is tricky, and it is possible for it to do the unexpected thing on occasions. He said he did not believe there is a way to escape human error.** [emphasis added]*

Jules E. Jenkins, an engineer specializing in seismological disturbance and the measurements of industrial noises, also appeared on behalf of the defendant, and testified that seismology is the science pertaining to the movement of earth.

*When explosives are used in quarry operations there is a wave motion known as energy, travelling in the earth, and it can be determined by the seismograph....Force or energy so created follows the course of least resistance in the earth. In terms of quarry operations with embedded blasting the airborne effect of blasting is nothing so far as structural effect or damage to a building nearby is concerned. With regard to personal property, it will knock such loose from hangings. Those manifestations would have no effect on concrete foundations. The only possible effect on the foundation is through the earth; the air blast would have no effect on plaster in rooms. On December 19, 1956 and on September 6, 1960 he went to the 367\*367 Peet residence at the time test blastings were made and seismograph measurements thereof were made in their home, and he testified as to the details of those shots, and measurements, 4433 pounds of explosives being used one time, 3291 pounds another time, and 2783 pounds another time, and he said the first test measurement was rated as having 37% of force compared to 100% for damage, and the others were rated at 10% of allowable vibration limits....In one of the tests the explosive was at a 75 foot depth, and in the others at a 60 foot depth. All tests were made at or about noon. He said they were not extensive enough to do any damage to the structure. **The damage criterion is predicated on***

*plaster. It is the building material which falls first. He further testified that no seismograph recordings were taken on March 8, 1957; he did not know what the defendant put in the blasting hole on March 8, 1957, or the amount of explosives. There were variables to take into consideration, — the shape of the explosive, the direction of the blast, the wind direction, the temperature, weather conditions, condition of the structure, location of the blasting hole, the force of the blast, and many others. He said the cracks in the Peet residence definitely could not have been due to embedded blasting. He said that transmission of the force of blasting to the Peet home had to go through the earth. He didn't know the variables involved here other than the distance of the house and the material by which the force was transmitted, and he said that it was necessary to take variables into consideration, and "any shot put up will have a certain amount of variables, come what may ... you will have variables with dynamite, you will have variances in the distances of rocks, with, if hard rock and spot soft, they are things that are natural parts of the business. [emphasis added] Within the working range of benches, I don't feel that they could by blast in that be enough energy in the ground to move that house at a distance of 800 feet."*

As noted by the court, no matter the degree of care or skill exercised in the handling of explosives, there is always the prospect of property damage and injury (or death) to persons for which there is liability, provided there is a causal connection between the damage and the blasting operation.

*One who makes use of an explosive in the ground near the property of another, when the natural and probable, though not inevitable, result of the explosion is injury to such property of the other, is liable for the resulting injury, however high a degree of care or skill may have been exercised in making use of the explosive; it is a matter of common knowledge that the use of dynamite as an explosive is intrinsically dangerous; this includes consequential injury resulting from an explosion by reason of concussion or vibration, as well as an injury resulting from rock or debris, etc. being thrown upon or against the other property; [emphasis added] in a case where there is liability the proper measure of damages is the cost of repairing the building and restoring it to its proper condition as it was before it was damaged by the explosion: *Fitzsimons etc. Co. v. Braun et al.* (1902) 199 Ill. 390, 65 NE 249; *Baker et al. v. S.A. Healy Co. et al.* (1939), 302 Ill. App. 634, 24 NE2d 228; *Opal et al. v. Material Service Corp.* (1956), 9 Ill. App.2d 433, 133 NE2d 733. It is not necessary that there have been negligence by the defendant. It is necessary that there be a causal connection between the alleged damage and the blasting operation. This is the majority view and is followed in Illinois. [emphasis added]*

The trial court ruled in favour of the homeowners and awarded damages, and the appellate court upheld the lower court's judgment.

## **Case Study 8**

In *Arras v. Columbia Quarry Co.*,<sup>157</sup> the homeowners were awarded damages for the loss of water in a 165-foot-deep well on their property occasioned by blasting operations at the defendant's quarry, located approximately one-half mile away. The Arrases have lived on the property since 1948, and the well on the property has been working since sometime in the 1800s, and provided water for all their needs until August 31, 1972, the day of the quarry blast.

*The plaintiffs testified that they were in their home on the afternoon of August 31, 1972....Mrs. Arras said that when she first felt the blast the house was vibrating, a cabinet door flew open and a cup fell out. She ran outside and could see the dust from the blast flying up. The blast, she said,*

<sup>157</sup> *Arras v. Columbia Quarry Co.*, 367 NE 2d 580 - Ill: Appellate Court, 5th Dist. 1977. [https://scholar.google.ca/scholar\\_case?case=12491414116569650571&q=Arras+v.+Columbia&hl=en&as\\_scl=2006&as\\_vis=1](https://scholar.google.ca/scholar_case?case=12491414116569650571&q=Arras+v.+Columbia&hl=en&as_scl=2006&as_vis=1).

was an especially heavy one. **She also stated that their well had been working properly that morning but after the blast there was no more water in it.** [emphasis added]

Mr. Arras...said that the evening of the blast the pump was pumping and would not shut off. The next day he checked to see if anything was wrong with the mechanism but found it intact. He put it back and started it again but there still was no water. **He put a hose down the pipe alongside the wooden rod that pumps the water and ran water into the well. It immediately started to pump but nothing came up except sludge.** [emphasis added]

**[A] neighbor of the Arrases[] testified that on August 31, 1972, about 3:30 p.m., there was a heavy blast and the earth was shaking and a "big smoke came up." She testified further that after the explosion the water in her well, which was 184 feet deep, disappeared and there was a crack in the foundation of her garage.** [emphasis added]

[Another neighbor] testified that she was fishing in a pond on her property at the time of the explosion on August 31, 1972. **She said that she heard the noise from the blast and felt the ground shake. She then saw the smoke rising in the air and was hit by debris [flyrock] from the explosion** [emphasis added]...[She] further testified that the water in her well, which was 200 feet deep, was muddy and she had to haul water in from elsewhere for a while after the explosion. She said that this happens when there are heavy blasts and that the water is usually clear again within 24 hours...[She] **said that after this blast her house had broken windows and cracks in the concrete.** [emphasis added]

Dohrman testified on behalf of the homeowners concerning the cost of drilling a new well:

*He stated that he had been in the business of well drilling and pump repair for 15 years. He said it would cost \$10 per foot to drill a well and gave an estimate of \$5223 based on a well depth of 425 feet. He testified that it would be necessary to drill 425 feet if not deeper to get to water on the Arrases' property. He said he had based his estimate on the depth of other wells in the neighborhood within a half-mile of the Arrases' property.*

A safety engineer from the Department of Mines and Minerals testified,

*That the amount of explosives used by the quarry company on August 31, 1972, should not have caused any damage to the Arrases' home or well.*

Another witness, John Mathes, a geotechnical engineer, testified concerning water tables and how they may change:

*He stated that natural changes in the subsurface conditions, which happen often, could have caused the loss of water in the well.*

The trial court awarded the homeowners damages of \$9,700. On appeal, the homeowners' award was reduced to \$5,223, consistent with the cost estimate provided by Dohrman for drilling a new well capable of reaching water at a much lower level below the surface of the ground.

## **Case Study 9**

*Gateway Estates Park Condominium Association*<sup>158</sup> manages a mobile home community of 220 homes and two vacant lots. The condominium association holds title to a number of common elements, including man-made South Lake that was excavated sometime before 1975 when the condominium was registered. In 2005, *SDI Quarry*, which operates the only mines at which blasting is conducted in close proximity to the community, began blasting at

<sup>158</sup> *SDI Quarry v. Gateway Estates Park Condominium Association*, 249 So.3d 1287 (2018)

three mines near South Lake, no closer than 7,000 feet (2.13 kilometres) from the mobile home community, averaging about 20 blasts a year. Each blast was monitored and the vibrations recorded. All were within lawful levels established by state law (the limit is a particle velocity (PPV) of 0.5 inches per second). None exceeded 0.2 PPV at South Lake, with most being 0.1 PPV. No damage to South Lake was evident for five to six years of blasting until 2011, when its shore first began to show signs of destabilization.

***In 2011, about five or six years after Appellee began its blasting activities, the shore of the South Lake began to destabilize, and saturated soil at the edge of the lake began to slough and slump into the water. This opened up fissures in the slope, which undermined the upward bank. In time, holes appeared in the bank, and pieces of the once level surface fell off, resulting in a narrowing of the horizontal area from roughly five feet to about a foot and a half. Residents observed the ground falling into the water in close temporal proximity to the blasting. [emphasis added]***

In late 2014 or early 2015, *Gateway Estates* retained James McNew, owner of Upper Keys Consulting, to give recommendations concerning restoration of the lake bank. Upper Keys Consulting prepared an estimate in the amount of \$840,000 for restoring the shore of South Lake and installing preventive devices to protect the shoreline against erosion from further blasting. This led to litigation against *SDI Quarry* under Florida's Construction Materials Mining Activities Administrative Review Act. Blasting continued without interruption, and between July 1, 2015 and October 17, 2016, there were twenty-five blasts. Based on this figure, the administrative law judge inferred that the number of historical blasts that had impacted South Lake was 200 to 250. Whether the detonations caused harm to South Lake's shoreline was the focal point of the administrative proceedings.

*[That] the blasts were all within state standards...doesn't negate potential liability.*

It was acknowledged that "no generally accepted scientific standard exists as to relevant threshold PPV levels for when man-made lakeshores would be adversely affected by vibrations from afar." McNew, over the objections of the *SDI Quarry*, was qualified to testify "as an expert on causation." McNew, holding a degree in mechanical engineering, had no training or significant education in seismology, geotechnical engineering, or geology. McNew testified that he consulted extensively with an engineer, and they produced a set of notes based on their extensive research of the literature, and these formed the basis of his opinion as the causes of the slope stability failures around South Lake.

*McNew opined that vibrations from Appellant's blasting caused the problems at Appellee's lake. Specifically, he explained that these vibrations acted upon the soft layer of silt atop the shore and bank of the South Lake, causing the liquefaction of this saturated soil extending up to eight feet beneath the surface. This led to the compaction of the loose, wet soil around the edges of the lake, opening up cracks and holes and weakening the slope, which began to erode and fail. McNew conceded that there were no legal standards in Florida or elsewhere establishing thresholds above which lakeshore slope instability would be expected under the stress of blast-related vibrations. In formulating his opinion, McNew stated that he used Transit Authority Guidelines rather than mining guidelines because the transit guidelines provided a more realistic standard where the damages were not to buildings. McNew also ruled out other possible causes such as earthquakes or heavy truck hauling near the lake.*

Ruling in favour of *Gateway Estates*, the administrative law judge found McNew's opinion on causation more persuasive than the competing view offered by *SDI Quarry's* experts. In doing so, the judge

*noted that Steven Black's categorical opinion that blasting could not be a cause of the damage to Appellee's lake was undercut by his concession that heavy truck traffic could affect the silt layer of a lakeshore over a continuous period of time. The administrative law judge also found that the circumstantial evidence supported McNew's opinion. Specifically, he noted that "the South Lake had existed for at least 35 years without experiencing the deterioration of the shore and bank that became noticeable within just five or six years after the start of the blasting, and which worsened over time as the blasting has continued." He also noted "the persuasive evidence that visible damage occurs in the wake of individual blasts."*

Black's evidence was accepted by the administrative law judge to the extent that wind, wave and rainwater was a natural cause of some of the bank erosion at South Lake, and found that *SDI Quarry's* blasting combined with the natural forces constituted a legal cause of the claimed property damages. Adding,

*'as a matter of fact,' the property damage at issue is present and continuing; the harm to the lakeshore is cumulative, indivisible, and inseparable.*

Finding that blasting is an ultra-hazardous activity for which strict liability is imposed, the administrative law judge concluded that *Gateway Estates* was not required to prove *SDI Quarry* was negligent or that *SDI Quarry's* blasting was the sole cause of *Gateway Estates'* damage. *Gateway Estates* was awarded \$840,000 in damages. In a continuing tort (trespass), the statute of limitations runs from the time of the last tortious act.<sup>159</sup> The Florida appeals court, in an unanimous ruling, upheld the administrative order.

### **Case Study 10**

*In Consbec Inc. v. Her Majesty the Queen*, it was alleged that Sidon's well (a neighbouring residential property) had been damaged and gone dry, as a consequence of a blast on March 28, 2004 at Weeks' quarry. The same blast also propelled flyrock beyond the limits of the property. *Consbec*, the blasting company, was charged under the Environmental Protection Act for releasing a contaminant "flyrock" into the environment. On May 12, 2008, *Consbec* pleaded guilty to the offence before the trial Justice of the Peace, resulting in a fine and restitution order to replace the neighbour's well. Nine crown witnesses and one witness on behalf of *Consbec* appeared at the sentencing. Most of the evidence of the witnesses called to give testimony at the sentencing hearing, including two experts, Mr. Hawley for the prosecution and Mr. Jambakhsh for *Consbec*, was reviewed by the trial Justice of the Peace. *Consbec* presented no contrary evidence,

*including, significantly, the lack of any pre-blast inspection of the Sidon's well, that "the water in the Sidon well prior to the blast in question was acceptable and usable, potable water".*

---

<sup>159</sup> In *Plaunt v. Renfrew Power Generation Inc.*, 2011 ONSC 4087 (CanLII) the reference to "The Law of Torts, 9<sup>th</sup> ed., John G. Fleming (Sydney: LBC Information Services, 1998), at page 48," that "[i]n many American blasting cases it has been held that damage from flying rocks is trespass, but from vibration or concussion at most nuisance," no longer reflects the state of common law. Claims of damages occasioned by "vibration or concussion" as a consequence of blasting are now treated as the tort of "trespass."

Despite the defendant's preliminary examination and challenge to the qualifications of the Crown's expert witness, Mr. Hawley was accepted by the trial Justice of the Peace "as an expert in well construction, well inspection and well water quality." The court also qualified Mr. Hawley "as an expert in well inferences including inferences from blasting based on his experience in resolving complaints of interference with well water quality or quantity during 57 investigations." According to Mr. Hawley,

*In his opinion, he testified that the blast in question has shaken the local bed rock sufficiently to create two likely problems. First, the vibration was sufficient to re-suspend soils in the bedrock fractures supplying the Sidon well and second, the seal that existed between the casing and the bedrock has been broken by the vibration. This would account for the re-occurrence of the cloudy water following a rainfall event and could explain the bacterial contamination of the well.*

### **Case Study 11 (Refusal to License a Lawful Quarry – Blasting Common Law Nuisance)**

At an environmental board hearing that lasted 10 days, followed by oral argument, and that generated 2,202 pages of testimony, the decision of the Environmental Hearing Board (EHB) to deny *Glasgow Quarry*<sup>160</sup> a permit to continue quarry operations on the grounds of inadequate public safeguards was upheld. On appeal *Glasgow Quarry* argued the sufficiency of *oral* and *visual* testimony, and as to whether the EHB applied the proper standards in its determination that the blasting operation constituted a common law industrial nuisance:

*[T]he permit requested in the May 3, 1973 application was denied on the grounds that the blasting procedures used and to be used did not adequately safeguard the public.*

Reports prepared by blasting experts of national reputation, together with seismographic reports, showed that vibrations "peak particle velocity," were substantially below the 2.0 level determined to be the "maximum allowable as recommended by the U.S. Bureau of Mines." Nevertheless, the testimony of the *Department of Environmental Resources'* (DER) expert, which included *oral* and *visual* testimony, proved more persuasive:

*The appellee [DER] offered one expert who made at least two trips to the site and examined the alleged blasting damages to property in the vicinity. His "visual" examination led him to conclude, taking all factors into consideration, that the blasting was causing the alleged damage.*

EHB's finding that blasting constitutes a *public nuisance* was also upheld on appeal, with the court commenting as follows:

*A study of the blasting cases in which the blasting was declared to be a nuisance indicates that where there is credible evidence that the blasting is causing damage to the property of others, as there is here, and if it is so found as a fact, as it has been here, a public nuisance does exist. See *Beecher v. Dull*, 294 Pa. 17, \*274 143 A. 498 (1928); *House of Refuge v. J. T. Dyer Co.*, 43 Pa. Super. 320 (1910). See also *Federoff v. Harrison Construction Co.*, 362 Pa. 181, 66 A.2d 817 (1949).*

### **Case Study 12 (Claim of Nuisance Over Quarry Truck Traffic)**

In 1991, the City of Greenwood (City) and Martin Marietta Materials, Inc. (MMM) entered into a contract that allowed trucking companies to use Second Avenue when traveling to

<sup>160</sup> *D.E.R. v. Glasgow Quarry*, 23 Pa. Commw. 270 (Pa. Commw. Ct. 1976) 351 A.2d 689.

and from the quarry. Use of Second Avenue occurred without incident until 2006, when, in an effort to control traffic, the city passed an ordinance (by-law) imposing weight restrictions on trucks travelling along Second Avenue. Subsequently, the City passed a second ordinance prohibiting commercial vehicles from using the city's streets unless the street was designated "Commercial Route." In effect, the ordinance prevented trucks from using Second Avenue. Subsequently, both ordinances were ruled invalid by the courts. The City of Greenwood then designated Second Avenue as the route to be used for quarry traffic. Greenwood is a town of about 4,500 residents in southeast Jackson County, MO. In December 2017, after a six-year legal battle, MMM was ordered to pay 18 current and former Greenwood residents a total of \$831,000, with separate verdicts ranging from \$6,590 to \$156,974, as damages for a claim of nuisance.

*Testimony at the three-week trial revealed that as many as 750 trucks a day rumble past their homes, shaking houses, breaking windows, spitting gravel and dust, sometimes exceeding the speed limit and preventing parents from letting their children play outside in their front yards.*

### ***Case Study 13 (Validity of Zoning Ordinance and Cumulative Effect)***

In *Lambrecht v. County of Will*,<sup>161</sup> the appeals court upheld the County's denial of a special use permit to allow *Lambrecht* to operate a quarry. The subject property consists of 185.44 acres of farmland zoned *A-1 Agricultural*, and is bounded on the south, east and west by other farms. Immediately north of the property is a single-family residential subdivision containing some older homes and some vacant lots. On appeal, the court rejected the plaintiff's argument that

*the ordinance was arbitrary, unreasonable and without a substantial relationship to the public health, safety, morals, or general welfare.*

The sole issue on appeal was whether the judgment of the trial court was contrary to the manifest weight of the evidence.

*"[A] zoning ordinance will be upheld if it bears any substantial relationship to the public health, safety, comfort or welfare. An ordinance will be presumed to be valid, and the one attacking an ordinance bears the burden of demonstrating its invalidity. The challenging party must establish by clear and convincing evidence that the ordinance, as applied, is arbitrary and unreasonable and bears no substantial relation to the public health, safety or welfare." Tomasek v. City of Des Plaines (1976), 64 Ill.2d 172, 179-80, 354 N.E.2d 899, 903 [para. 594].*

As to whether a quarry operation was an appropriate use of the land in the context of the surrounding land uses and the character of the community, the court conducted an assessment of relevant criteria to make that determination:

*The parties agree that the relevant factors in determining the validity of a zoning ordinance are: (1) the existing uses and zoning of nearby property; (2) the extent to which property values are diminished by the particular zoning restrictions; (3) the extent to which the destruction of the property values of plaintiff promotes the health, safety, morals, or general welfare of the public; (4) the relative gain to the public as compared to the hardship imposed upon the property owner; (5)*

---

<sup>161</sup>*Lambrecht v. County of Will*, 217 Ill. App. 3d 591 (Ill. App. Ct. 1991) 577 N.C.2d 789, [https://scholar.google.com/scholar\\_case?case=13855044279831539095&q=lambrecht+v+county+of+will&hl=en&as\\_sdt=2006](https://scholar.google.com/scholar_case?case=13855044279831539095&q=lambrecht+v+county+of+will&hl=en&as_sdt=2006).

the suitability of the subject property for the zoned purposes; and (6) the length of time the property has been vacant as zoned considered in the context of land development in the area. (*La Salle National Bank v. County of Cook* (1957), 12 Ill.2d 40, 145 N.E.2d 65.) Additional considerations include the degree of care which the community has taken to plan its land use development and any evidence of community need for the proposed use. (*Sinclair Pipe Line Co. v. Village of Richton Park* (1960), 19 Ill.2d 370, 167 N.E.2d 406.) No one factor is controlling. *La Salle National Bank*, 12 Ill.2d 40, 145 N.E.2d 65 [para. 594].

The cumulative effect of a number of potential adverse impacts on the community were cited by the appeals court in upholding the lower court's ruling in favour of the County to deny a permit to operate a quarry:

*Given the evidence of the incompatibility of a quarry operation with surrounding land uses, the potential effect on the groundwater supply, the effects of blasting on nearby property, and the impact on the value of neighboring property, we agree with the trial court that plaintiffs have not proved by clear and convincing evidence that denial of the special use permit was arbitrary, unreasonable, and without a substantial relationship to the public health, safety, or general welfare. Cf. Meyer Material Co. v. County of Will (1977), 51 Ill. App.3d 821, 366 N.E.2d 1149 [para. 602].*

### **Origin of the Rule – Strict Liability**

The origin of the rule of strict liability stems from common law dating back to an 1868 case in England:<sup>162</sup>

*Courts have often identified blasting (the controlled use of explosives to break down or remove rocks) as the paradigm of an abnormally dangerous activity because of its inherent dangers, and they applied strict liability in cases where blasting resulted in physical harm. **The victims of physical harm resulting from blasting were often totally innocent and uninvolved in the activity, while the persons conducting the blasting were doing so for their own financial benefit and were well-aware of the risks. Courts therefore took the position that defendants should be held strictly liable for any harm caused by projected debris.*** [emphasis added] See *Restatement (Third) of Torts § 20, cmt.(e)* (2009).

*In Rylands v. Fletcher, an English case from 1868, the opinion read that "[a] person who for his own purposes brings on his lands and collects and keeps there anything likely to do mischief if it escapes, must keep it in at his peril." American courts often cite this case as providing the origin of the rule on abnormally dangerous activities. In US jurisdictions, courts have never required that the activity take place on the defendant's land. However, they retained the requirement of "unnatural use" in the form of "not of common usage", meaning an activity that is unreasonable or inappropriate in light of the circumstances. See Restatement (Third) of Torts § 20, cmt.(d)* (2009).

### **Precautionary Principle**

In *Spraytech v. Hudson (Town)*,<sup>163</sup> the Supreme Court of Canada adopted the Precautionary Principle, as enunciated in the Bergen Ministerial Declaration on Sustainable Development (1990):

<sup>162</sup> Legal Information Institute [https://www.law.cornell.edu/wex/abnormally\\_dangerous\\_activity](https://www.law.cornell.edu/wex/abnormally_dangerous_activity). See also "Torts—Blasting—Basis of Liability: Negligence, Trespass or Absolute Liability," *North Carolina Law Review* (Vol 40, No. 3, 4-1-1962): 640-647. <http://scholarship.law.unc.edu/cgi/viewcontent.cgi?article=6006&context=nclr>. See also Tim Wood, Sticks and Carrots: *Rylands v Fletcher*, CSR, and Accountability for Environmental Harm in Common Law Jurisdictions, 2013 91-2 *Canadian Bar Review* 275, 2013 CanLIIDocs 172, <<http://www.canlii.org/t/28gr>>, retrieved on 2020-01-16.

<sup>163</sup> 114957 *Canada Ltée (Spraytech, Société d'arrosage) v. Hudson (Town)*, [2001] 2 SCR 241, 2001 SCC 40 (CanLII), <<http://canlii.ca/t/51zx>>, retrieved on 2019-11-10.

*In order to achieve sustainable development, policies must be based on the precautionary principle. Environmental measures must anticipate, prevent and attack the causes of environmental degradation. Where there are threats of serious or irreversible damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation [p. 31].*

The Supreme Court acknowledged that the Precautionary Principle has been included in virtually every adopted treaty and policy document related to the protection and preservation of the environment:

*Scholars have documented the precautionary principle's inclusion "in virtually every recently adopted treaty and policy document related to the protection and preservation of the environment"<sup>164</sup> As a result, there may be "currently sufficient state practice to allow a good argument that the precautionary principle is a principle of customary international law."<sup>165</sup> The Supreme Court of India considers the precautionary principle to be "part of the Customary International Law"<sup>166</sup> In the context of the precautionary principle's tenets, the Town's concerns about pesticides fit well under their rubric of preventive action [para. 32].*

In *Sierra Club v. Strock et al.*,<sup>167</sup> the permitting agencies failed to comply with their own regulatory legislation, and ignored the tenets of the precautionary principle with devastating and irreversible consequences to the public after nine permits were issued to permit quarrying for limestone from wetlands. The United States District Court supplemented the Court's Order of March 22, 2006, which concluded that United States Corps of Engineers, United States Fish and Wildlife Service, Vecellio and Grogan, Inc., Tarmac America LLC, Florida Rock Industries, Inc., Sawgrass Rock Quarry, Inc., Apac-Florida, Inc., Rinker Materials of Florida, Inc., and Kendall Properties and Investments had committed multiple violations of the Administrative Procedures Act (APA), the Endangered Species Act (ESA), the Clean Water Act (CWA), and the National Environmental Policy Act (NEPA).

*The violations occurred in relation to the issuance of permits in April 2002 to nine private corporations for the destruction of approximately 5,400 acres of wetlands in order to remove the underlying limestone for processing into cement, concrete blocks, and other products.*

*The Court's Order granting summary judgment for Plaintiffs found that Defendants, the United States Army Corps of Engineers ("Corps") and United States Fish and Wildlife Service ("FWS"), had made numerous decisions lacking a rational basis and had failed to consider all relevant factors in their permitting decision; further, the Court found that the record in this case prior to issuance of the permits compelled the conclusion "that the permits should not have been issued." [emphasis added] [Sierra Club v. Flowers, 423 F.Supp.2d 1273, 1379 \(S.D.Fla.2006\)](#).*

*Shockingly, the Court learned for the first time during the evidentiary hearing, in June 2006, that benzene, a carcinogen,<sup>191</sup> had been detected as early as January 2005 in the water being pumped*

<sup>164</sup> D. Freestone and E. Hey, "Origins and Development of the Precautionary Principle", in D. Freestone and E. Hey, eds., *The Precautionary Principle and International Law* (1996), at p. 41.

from the Biscayne Aquifer ("Aquifer"), "the primary source of drinking water for the Miami — Dade County area." AR1028,<sup>[10]</sup> p. 4. The contamination was found in the area where limestone mining, which uses explosives<sup>[11]</sup> to remove the limestone from the Aquifer, is proceeding pursuant to the challenged permits. The contamination was so significant<sup>[12]</sup> that Miami — Dade County's Water and Sewer Department ("WASD") (the agency responsible for the delivery of drinking water for the County) shut down seven of the fifteen production wells which draw water from the Aquifer in that area, known as the Northwest Wellfield ("Wellfield"), and pump it to water treatment plants several miles away.<sup>[13]</sup> More than two years after the initial contamination incident,<sup>[14]</sup> Miami-Dade County's Department of Environmental Resources Management ("DERM"), the agency responsible for protecting the Wellfield, announced that it could not eliminate the mining-related blasting as a source of the benzene.<sup>[15]</sup> DERM's report concluded that the 1192\*1192 two reported contamination periods (January 2005 to February 2006, and a second episode beginning in August 2006) were not caused by several other potential sources.<sup>[16]</sup>

Despite protestations to the contrary, it appears likely that the Corps-permitted mining activities, specifically the blasting used to dislodge the limestone<sup>[17]</sup> from the Aquifer, are a source of the benzene. A significant portion of the mining occurs in this same Wellfield where the contamination was discovered — some of the active mining operations are less than 3000 feet from the production wells. The Court need not determine conclusively<sup>[18]</sup> whether 1193\*1193 the benzene originated from mining-related blasting as the contamination itself (and the Corps' failure to treat it as significant) is sufficient to expose the Corps' ongoing violations and dereliction of their duties under the CWA, NEPA, and APA.<sup>[19]</sup> When the Court questioned the Defendants' primary witness as to why the benzene contamination had not been included in the report of the Corps' "Three Year" review required by the permits,<sup>[20]</sup> his response was: "[W]e don't have any clear indication from the County that it's a problem." Tr. 2776 (John F. Studt).<sup>[21]</sup>

The Corps' shifting of responsibility to the County,<sup>[22]</sup> combined with a complete failure to advise not just this Court (during the pendency of these proceedings) but 1194\*1194 also the public as to the contamination of the Wellfield by benzene and the potential connection to the mining activities,<sup>[23]</sup> eliminated the possibility of meaningful public participation required by NEPA and the CWA.<sup>[24]</sup> In summary, the Corps' lack of concern about the benzene contamination represents a failure to fulfill its legal obligations to conduct the agency's permitting activities with transparency.<sup>[25]</sup> This is just one example of the many errors made by the Corps in failing to provide accurate information for public assessment and review throughout the permitting process.<sup>[26]</sup>

1195 Defendants' lack of transparency and clarity in the permitting process also have made the "public interest" issues<sup>[27]</sup> difficult to grasp in this case. It is impossible to discern precisely what is at issue under these permits with respect to the number of acres to be mined, the precise locations and types of mining impacts at any given point in time, and the total length of time during which the mining activities may proceed.<sup>[28]</sup> **Defendants rely on the permittees to report the number of acres mined and wetlands impacted, but the permittees use different descriptive terms than those used by the Defendants — raising a question as to whether there is or could be any meaningful monitoring to ensure the accuracy of the reporting of impacts.**<sup>[29]</sup> [emphasis added] The Defendants offered very little<sup>[30]</sup> to support their untenable position that the alleged benefits to the economy outweigh risks of environmental harm from the continued mining.<sup>[31]</sup> Nor is it an easy task to test the Intervenor's arguments that there are insufficient 1196\*1196 alternative sources of limestone to replace the rock being harvested under these permits, and that any reduction in mining will be devastating to the mining companies,<sup>[32]</sup> their employees, and the population in general.<sup>[33]</sup> Without an accurate baseline against which to measure the planned future mining impacts, and in light of the widely varying mining production levels of the different permittees, it is difficult to assess whether there might be alternative sources for some of the mining activities for at least some period of time.<sup>[34]</sup>

As noted in this Court's earlier Order, the Court's duty is to "immerse" itself in the evidence and determine whether the agency decision was rational and based on consideration of the appropriate factors. **The Court has endeavored to understand the full extent of the scientific evidence regarding the conditions of the Aquifer and its vulnerability to contamination.**<sup>[35]</sup> **From a review of the evidence, the Court has understood the primary message to be essentially undisputed:**<sup>[36]</sup> **the deep, vast quarry pits left behind from the mining 1197\*1197 activity**

**expose the Aquifer (and the drinking water drawn therefrom by the pumps in the Wellfield) to a greater risk of contamination than if the pits were not present.<sup>[37]</sup> Regardless of whether the existing or planned municipal water treatment facilities will be able to treat those incidents of benzene contamination which already have occurred, or any potential future contamination by benzene or pathogens such as cryptosporidium or giardia, it nevertheless remains an exceedingly significant occurrence that a previously pristine Aquifer has suffered these grave problems. [emphasis added]** The Court finds that the evidence clearly establishes that the CWA and ESA compel denial of these mining permits, and also that the Corps' governing regulations, as well as the intent and letter of NEPA and the APA have been violated by the Corps' issuance of these permits.<sup>[38]</sup> The principles governing judicial review of agency actions direct that the Court approve an agency decision even if the Court disagrees with the agency,<sup>[39]</sup> as long as the agency's conduct is compliant with the law, i.e., is not "arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law, or without observance of procedure required by law." 5 U.S.C. § 706(2)(A).<sup>[40]</sup> 1198\*1198 However, "[t]he failure of an agency to comply with its own regulations constitutes arbitrary and capricious conduct," Simmons v. Block, 782 F.2d 1545, 1550 (11th Cir.1986),<sup>[41]</sup> and subjects the agency action to reversal according to the APA. 5 U.S.C. § 706(2)(a).

**In three decades of federal judicial service, this Court has never seen a federal agency respond so indifferently to clear evidence of significant environmental risks related to the agency's proposed action.<sup>[52]</sup> It may be that the power of "economics" 1201\*1201 (i.e. financial profit to be gained from further production of building materials) unduly influenced the Corps. The events preceding the issuance of the EIS and the Record of Decision ("ROD"), specifically when the Corps seemed to wilt in the presence of pressure for approval of the permits, suggest such a conclusion. 423 F.Supp.2d at 1287-88.<sup>[53]</sup> It now appears that even the local governmental agencies have yielded, perhaps as a result of increasing pressure from the mining companies or others.<sup>[54]</sup> Recently, the County restarted some of the production wells which had been shut down more than two years ago due to benzene-related contamination issues.<sup>[55]</sup> CAP, p. 5. Under the presumption that benzene will continue to be found, the County appears to have conceded that upgrades to the water treatment plant which handles the majority of the County's drinking water are necessary<sup>[56]</sup> in order to prepare for the perhaps inevitable reclassification of the Wellfield 1202\*1202 from "groundwater" to "groundwater under the direct influence of surface water" ("GWUDI")<sup>[57]</sup> by federal and state authorities. Even if the water treatment plants are able to treat the raw water for the anticipated amounts of benzene, it is nevertheless of grave concern that benzene will now regularly affect a previously pristine Aquifer.<sup>[58]</sup> **The ability to cure a problem does not justify its creation. It is improper for these risks to be imposed solely on the public, including the risk that the public will have to pay a substantial sum to upgrade the water treatment facilities, particularly when the private sector earns enviable profits on the harvesting of these non-renewable natural resources. [emphasis added]****

According to the Interdepartmental Liaison Group on Risk Assessment (ILGRA) of the United Kingdom,<sup>168</sup> the precautionary principle was originally framed in the context of preventing environmental harm, but is now widely accepted as applying more broadly to include the threat of harm to human, animal or plant health. The precautionary principle is forward looking and applied proactively:

*The purpose of the Precautionary Principle is to create an impetus to take a decision notwithstanding scientific uncertainty about the nature and extent of the risk, i.e. to avoid 'paralysis by analysis' by removing excuses for inaction on the grounds of scientific uncertainty [p. 6].*

*The precautionary principle should be invoked when:*

- i. *there is good reason, based on empirical evidence or plausible causal hypothesis, to believe that harmful effects might occur, even if the likelihood of harm is remote; and*

---

<sup>168</sup> The Precautionary Principle: Policy and Application, <https://www.hse.gov.uk/aboutus/meetings/committees/ilgra/pppa.pdf>.

- ii. *a scientific evaluation of the consequences and likelihoods reveals such uncertainty that it is impossible to assess the risk with sufficient confidence to inform decision-making.*

*The Precautionary Principle:*

- *is narrower than 'being cautionary'; and*
- *is not relevant unless scientific uncertainty is a significant factor and there is good reason to expect harmful effects.*

A lack of scientific certainty in addressing potential non-trivial adverse environmental (and potentially catastrophic) impacts and the threat of harm to human, animal and plant life is not a reasonable basis for issuing an aggregate licence (or permit) to permit a quarry operation.

## **CONCLUSIONS & OBSERVATIONS**

- 1) The Ontario government has a moral responsibility and legal duty to protect its citizens and the environment from the potentially lethal consequences of flyrock. Most incidents of flyrock go unreported, concealing the true extent of the problem.
- 2) Blasting is “ultrahazardous” or “abnormally dangerous,” and proposed quarries that intend to blast to extract aggregate must be restricted to sparsely populated rural areas, far removed from settlements, and appropriately setback from all wells, residences, livestock, infrastructure (e.g., major arterial roads and highways, gas lines), sensitive landmarks, watercourses and topographical features.
- 3) The idea that residents and pets must hustle into their homes (which may not protect them or their homes from flyrock) at the alarming sound of warning horns and blasts is akin to being under siege in wartime, with the potential for long-term physical, emotional and psychological issues (e.g., sleep disturbance, hearing loss, Tinnitus, Post-traumatic Stress Disorder, respiratory illnesses from dust inhalation, etc.)
- 4) Petty fines and short-term licence suspensions in Ontario are an inadequate deterrent to operators of quarries who cause injury to the public, the environment, livestock, pets, and wildlife; damage services (e.g., well, septic, hydro, cable, gas); and destroy property values.

*“[B]etween 1973 and 1989, the Ministry [of Natural Resources] initiated 154 prosecutions and obtained 81 convictions. The total fines levied amounted to about \$72,000.” Comparing this to the enforcement record of the Minister of Environment and Energy, they point out that the Ministry of Natural Resources had therefore undertaken “fewer prosecutions over a 17-year period than the Ministry of Environment and Energy undertakes in a single year.” They also note that as of 1993 the Ministry had not revoked any aggregate licences [p. 175].<sup>169</sup>*

- 5) Many of the potential adverse effects associated with quarry blasting could be avoided if a minimum setback of 800 metres from any sensitive land use (or activity) is imposed on an application for a new quarry or expansion of an existing quarry.
- 6) The Precautionary Principle, as contemplated by the Statement of Environmental Values (SEV), should be applied to all applications for aggregate licences to avoid potential major adverse environmental impacts, especially those that are potentially irreversible, and to avoid potential harm to human, animal and plant life. “What if” risk assessment scenarios and the feasibility of each scenario should be a mandatory component of every application for a quarry permit.
- 7) Consultant reports commissioned by an applicant for an aggregate licence/permit that contain exculpatory clauses, and deny reliance on the report by third parties (e.g., MNRF, MOECC, municipality, impacted neighbours/citizen coalitions, etc.), such as the example that follows, should be rejected:

*This report was prepared for the exclusive use of (Applicant). Any use which a third party makes of the report, or any reliance on, or decisions to be made based on it, are the*

*responsibilities of such third parties. (Consultant) accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions taken based on this report.*

It is important for all third-party approving governmental authorities (municipal, provincial and federal) and other impacted third-parties be allowed to rely on an applicant-commissioned consultant's report should the report turn out not to have been prepared to an acceptable standard and led to environmental harm, personal injury or property damage. Otherwise, a valid third-party claim of negligence against the consultant might not be sustained.

A third-party governmental agency overpaid for property at taxpayer expense by relying on an unauthorized appraisal report:

*The February 12, 2013, 42-page appraisal was prepared for the exclusive use of Royalty Developments Limited (Pres: Anthony Marquart)...and lenders of their choosing, and they were listed as the only intended users of the appraisal report, which precluded the GTHA from relying on the report. The appraisal report has not been made public. In fact, the Saskatchewan Privacy Commissioner ordered all copies in the possession of the government destroyed or returned to the appraiser, as GTHA did not pay for the appraisal and because "the GTH was inappropriately provided a copy of the appraisal" without written authorization of the appraiser. In reaching this decision,...the Commissioner made note of the following restrictions placed in the appraiser's report:*

- *The intended use of the appraisal is for internal uses of the client and to assist with financing arrangements relating to the subject property.*
- *It is not reasonable for any other person other than the client, the lender of the client's choice, and [the appraisal firm] to rely upon this appraisal without first obtaining written authorization from all parties.*
- *This report has been prepared on the assumption that no other person will rely on it for any other purpose and all liability to all such persons is denied. [para. 15] [emphasis added] Except as it may be necessary to expedite the function of this appraisal as identified herein, it is not reasonable for any person other than the client, the lender of the client's choice, and [the appraisal firm] to rely upon this appraisal without first obtaining written authorization from all parties. [para. 16]*
- *Neither possession of this report nor a copy of it carries with it the right of publication. All copyright is reserved to the author and is considered confidential by the author. It shall not be disclosed, quoted from or referred to, it [sic] whole or in part, or published in any manner without the expressed written consent of the client and [the appraisal firm]. [para. 16]*

*The GTHA failed to heed the disclaimers and cautions prominently placed up front in the appraisal report—not buried or deliberately concealed in the body of the report. There is nothing ambiguous about the language that would cause confusion or misunderstanding. No satisfactory explanation has been provided to justify the government's reliance on a report clearly marked as to the intended users and the intended use. Even if the GTHA had been an intended user of the appraisal, other aspects of the appraisal should have raised concerns.<sup>170</sup>*
