

Paulownia Phoenix One Visuals

This document provides photographic examples of the non-native element of the project. The specific Paulownia species is Phoenix One, a sterile hybrid, bred from *Elongata* and *Fortunei*, and planted at a relatively low stocking density of 825 trees/ha.

The images below depict intensive plantations with Paulownia making up 100% of the planted species mix, and fail to portray the native woodland and open area clover mixes incorporated into this proposal, intended to soften the potentially regimented appearance of the plantations whilst promoting unity with the existing landscape.
